This book sets out an extensive argument against the foundationalist theories of justification, and advocates new life for philosophy of science. The author brings together aspects of an ontology of the interpretative constitution of research objects and a holistic picture of science's cognitive structures. The book is a contribution to a wide range of discussion concerning the post-Gadamerian extension of philosophical hermeneutics beyond the scope of the traditional humanistic culture. Pragmatism and Objectivity illuminates the nature of

contemporary pragmatism against the background of Rescher's work, resulting in a stronger grasp of the prospects and promises of this philosophical movement. The central insight of pragmatism is that we must start from where we find ourselves and deflate metaphysical theories of truth in favor of an account that reflects our actual practices of the concept. Pragmatism links truth and rationality to experience, success, and action. While crude versions of pragmatism state that truth is whatever works for a person or a community, Nicholas Rescher has been at the forefront of arguing for a more sophisticated pragmatist position. According to his position, we can

illuminate a robust concept of truth by considering its links with inquiry, assertion, belief, and action. His brand of pragmatism is objective and organized around truth and inquiry, rather than other forms of pragmatism that are more subjective and lenient. The contingency and fallibility of knowledge and belief formation does not mean that our beliefs are simply what our community decides, or that truth and objectivity are spurious notions. Rescher offers the best chance of understanding how it is that beliefs can be the products of human inquiry yet aim at the truth nonetheless. The essays in this volume, written by established and up-and-coming scholars of

Applied Behavior Science in Organizations provides a compelling overview of the history of Organizational Behavior Management (OBM) and the opportunity it presents for designing and managing positive work environments that can in turn have a positive impact on society. The

book brings together leading experts from industry and research settings to provide an overview of the historical approaches in Organizational Behavior Management. It begins with an introduction to recognized practices in OBM and the applications of fundamental principles of behavior analysis to a variety of performance problems in organizational settings. The book then highlights how organizational practices and consumers' behavior combine in a complex confluence to meet an organization's goals and satisfy consumer appetites, whilst

often unintentionally affecting the wellbeing of organizational members. It argues that the science of behavior has a responsibility to contribute to the safety, health and wellbeing of organizational members, consumers of organizational products, and beyond. Finally, the book recognizes the essential role of organizations in initiating, shaping, and sustaining the development of more nurturing and reinforcing work environments, through discussion of the need for innovation while adapting and responding to growing social

upheaval, technological advances, and environmental concerns, alongside crises in the global economy, health, education, and environment. Showcasing emerging work by internationally recognized scholars on the application of behavior science in organizations, the book will be an essential read for all students and professionals of Organizational Behavior Management, as well as those interested in using organizational applications to create new models of management. With tools borrowed from Statistical Physics and Complexity, this new area of study have already made important contributions, which in turn have fostered the development of novel theoretical foundations in Social Science and Economics, via mathematical approaches, agent-based modelling and numerical simulations. From these foundations, Computational Social Science has grown to incorporate as well the empirical component --aided by the recent data deluge from the Web 2.0 and 3.0--,

"Can you Count the Clouds?" asks the voice of God from the whirlwind in the stunningly beautiful catalogue of nature-questions from the Old Testament Book of Job. Tom McLeish takes a scientist's reading of this ancient text as a centrepiece to make the case for science as a deeply human and ancient activity, embedded in some of the oldest stories told about human desire to understand the natural world. Drawing on stories from the modern science of chaos and uncertainty alongside medieval, patristic, classical and Biblical sources, Faith and Wisdom in Science challenges much of the current

'science and religion' debate as operating with the wrong assumptions and in the wrong space. Its narrative approach develops a natural critique of the cultural separation of sciences and humanities, suggesting an approach to science, or in its more ancient form natural philosophy - the 'love of wisdom of natural things' - that can draw on theological and cultural roots. Following the theme of pain in human confrontation with nature, it develops a 'Theology of Science', recognising that both scientific and theological worldviews must be 'of' each other, not holding separate domains. Science finds its place within

an old story of participative reconciliation with a nature, of which we start ignorant and fearful, but learn to perceive and work with in wisdom.

Surprisingly, science becomes a deeply religious activity. There are urgent lessons for education, the political process of decision-making on science and technology, our relationship with the global environment, and the way that both religious and secular communities alike celebrate and govern science.

Annotation Confronting head-on the intellectual challenges raised by postmodern thought, this volume offers a convincing defense of human reason and the legitimacy of theological reflection. Building on the line of argument pursued in his most recent writings, J. Wentzel van Huyssteen here develops his notion of a "postfoundationalist rationality", finding within the rich resources of human thought the possibility -- and vital need -- for complementary dialogue between religion and science. Learned and fully engaged with current philosophical trends, this volume is a must-read for anyone seeking a sound foundation for faith in a scientifically oriented world.

This book discusses the scope of science education research and practice in Asia. It is divided into five sections: the first consists of nine chapters providing overviews of science education in Asia (China, Lebanon, Macau, Malaysia, Mongolia, Oman, Singapore, Taiwan, and Thailand). The second section offers chapters on content analysis of research articles, while the third includes three chapters on assessment and curriculum. The fourth section includes four chapters on

Each section also has additional chapters providing specific comments on the content. This collection of works provides readers with a starting point to better understand the current state of science education in Asia.

This book engages with, and contests, the 'new sociology of nature'. It moves beyond existing debates by presenting new social theory and working across current fields of interest, addressing the debate on new genetics and genomics, taking human biology seriously, and the issues of interdisciplinarity that are likely to arise in longer term attempts to work across the social and natural world.
