Packed with essential lists, figures, tables, and algorithms, the Tarascon Internal Medicine & Critical Care Pocketbook, Fifth Edition provides instant reminders of hard-to-remember yet vitally important clinical information. The Fifth Edition contains more information and several new topics throughout each chapter, including: Anthropometric Equations; Echo, MRI, and Nuclear Anatomy; ECG ST Elevation (STE) Patterns; Sepsis; Therapeutic Hypothermia; Pharyngeal Swab Technique; NIH Stroke Scale; Bronchoscopic Anatomy; SIADH; Serotonin Syndromes; and more. Intended for busy internal medicine physicians, nurses, or any healthcare provider in the ICU, Tarascon Internal Medicine & Critical Care Pocketbook is meticulously referenced with expert commentary on current academic controversies in the field.

Delays in recognising deterioration or inappropriate management of people in acute care settings can result in late treatment, avoidable admissions to intensive care units and in some instances unnecessary deaths. As the role of the nurse in healthcare settings continues to change and evolve, today's student nurses need to be equipped with the fundamental skills to recognise and manage deterioration in the patient in a competent and confident manner, as you learn to become practitioners of the future. Using a body systems approach and emphasising the central role and function of the nurse throughout, this book provides a comprehensive overview of the essential issues in this important subject. Topics covered include: recognition and identification of physiological deterioration in adults; identification of disordered physiology that may lead to a medical emergency linked to deterioration of normal function; relevant anatomy and physiology; pathophysiological changes and actions that need to be taken; immediate recognition and response; investigations, diagnosis and management issues; and teaching and preventative strategies.

This book is the first of a new series which will present the proceedings of the newly established Nestlé Nutrition Workshop Series: Clinical & Performance Programme aimed at adult nutrition. Undernutrition is a common phenomenon in elderly people, and malnutrition reaches significant levels in those being in hospital, nursing homes or home care programs. Consequences of malnutrition often go unrecognised owing to the lack of specific validated instruments to assess nutritional status in frail elderly persons. The Mini Nutritional Assessment (MNA) provides a single, rapid assessment of nutritional status in the elderly of different degrees of independence, allowing the prevalence of protein-energy malnutrition to be determined and to evaluate the efficacy of nutritional intervention and strategies. Easy, quick and economical to perform, it enables staff to check the nutritional status of elderly people when they enter hospitals or institutions and to monitor changes occurring during their stay. Moreover, the MNA is predictive of the cost of care and length of stay in hospital. This publication will be of immense assistance to heads of geriatric teaching units, teachers in nutrition, clinicians general practitioners and dietitians, enabling them to better detect, recognise and start treatment of malnutrition in the elderly.

This edition is presented in a totally new and reader-friendly format. The focus of this volume is on holistic management of critically ill adult patients and it builds upon concepts one step at a time – allowing one the opportunity to develop competence at one's own pace.

Lipids have been in clinical use as components of intravenous nutrition for over 50 years. Over the last 15 years, new and improved lipids that include olive oil and/or fish oil have replaced the more traditional ones. These new lipids offer the opportunity to deliver high amounts of fatty acids and possess different functional properties: in particular, they can influence inflammatory processes, immune responses and hepatic metabolism. This book brings together articles written by leading international authorities in the area of intravenous lipids. Contributions discuss the latest findings in the field, ranging from pre-clinical research to the most recent clinical trials. Lipid functionality and utility in pediatric, adult surgical and critically ill patients are covered, as is the use of lipids in long-term home parenteral nutrition. Addressing a broad spectrum of topics, this publication provides a wealth of information for basic scientists, clinical researchers and clinical practitioners alike.

Addresses the challenges of managing critically ill obstetric patients, with chapters authored by intensivists/anesthesiologists and obstetricians/maternal-fetal medicine specialists.

Present Knowledge in Nutrition, Eleventh Edition, provides an accessible, highly readable, referenced, source of the most current, reliable, and comprehensive information in the broad field of nutrition. Now broken into two, separate volumes, and updated to reflect scientific advancements since the publication of its tenth edition, Present Knowledge in Nutrition, Eleventh Edition includes expanded coverage on the topics of basic nutrition and metabolism and clinical and applied topics in nutrition. This volume, Present Knowledge in Nutrition: Clinical and Applied Topics in Nutrition, addresses life stage nutrition and maintaining health, nutrition monitoring, measurement, and regulation, and important topics in clinical nutrition. Authored by an international group of subject-matter experts, with the guidance of four editors with complementary areas of expertise, Present Knowledge in Nutrition, Eleventh Edition will continue to be a go-to resource for advanced undergraduate, graduate and postgraduate students in nutrition, public health, medicine, and related fields; professionals in academia and medicine, including clinicians, dietitians, physicians, and other health professionals; and academic, industrial and government researchers, including those in nutrition and public health. The book was produced in cooperation with the International Life Sciences Institute (<https://ilsi.org/>). Provides an accessible source of the most current, reliable and comprehensive information in the broad field of nutrition Features new chapters on topics of emerging importance, including the microbiome, eating disorders, nutrition in extreme environments, and the role of nutrition and cognition in mental status Covers topics of clinical relevance, including the role of nutrition in cancer support, ICU nutrition, supporting patients with burns, and wasting, deconditioning and hypermetabolic conditions

Reaching beyond traditional nutrition support The care of ICU patients has seen many improvements over the years, both with regard to technical aspects and supportive measures. The first part of this book analyzes nutritional support at various levels, ranging from the cell level to the whole-body aspect; drawing on recent prospective randomized studies, the authors propose a new approach for oral, enteral and/or parenteral nutrition. The second part underlines the interference between nutrition and outcome to reach recovery, giving to this field an increased importance for better short and long term management: The best glucose control, individualized nutritional support and the avoidance of harmful interferences is extensively discussed. The final part deals with patients suffering from multi-organ failure and the need for a better understanding of the interactions between disease and nutrition. Identification of the metabolic condition of the patient, existence or not of evidence-based medicine, expert opinion, treatment opportunities and the case manager recognizing threats are all integrated to reach the appropriate decision. This last part will help the reader to untangle the complexity of the ICU patient of the 21st century and to propose a personalized nutritional support process.

Finding all the information necessary to treat or meet the nutritional requirements of patients who are severely ill or establish new protocols has historically been problematic. This is addressed in Diet and Nutrition in Critical Care. This major reference work encapsulates the latest treatments and procedures to meet the dietary and nutritional needs of the critically ill. Where evidence is available this is presented. However, where evidence is absent, the authors highlight this and provide guidance based on their analysis of other available data and their clinical experience. Diet and Nutrition in Critical Care is a three volume set which addresses the needs of all those concerned with diet and nutrition in the critically ill and covers General Aspects, Enteral Aspects, and Parenteral Aspects. Each volume is stand alone and is further divided into separate sections. The Sections in the General Aspects are: General conditions in the severely ill General metabolic effects and treatments Assessment protocols General nutritional aspects Specific nutrients Adverse aspects The next two volumes Enteral Aspects and Parenteral Aspects contain the following sections: General aspects and methods Specific nutrients Specific conditions Adverse aspects and outcomes Comparisons or dual parenteral and enteral support or transitions Preclinical studies The authors recognise the limitations in simplistic divisions and there is always difficulty in categorising treatment regimens. For example, some regimens involve transitions from one feeding protocol to another or the development of co-morbid conditions and in some cases enteral support may be supplemented with parenteral support. This complexity however, is addressed by the excellent indexing system. Contributors are authors of international and national standing, leaders in the field and trendsetters. Emerging fields of science and important discoveries relating to artificial support will also be incorporated into Diet and Nutrition in Critical Care. This volume represents a one stop shop of material related to enteral and parenteral support and is essential reading for those specialising in intensive and critical care, dietitians, nutritionists, gastroenterologists, cardiologists, pharmacologists, health care professionals, research scientists, molecular or cellular biochemists, general practitioners as well as those interested in diet and nutrition in general.

Although of vital importance, nutrition is still a neglected issue in medical curricula - a fact that this book is aiming to remedy by addressing topics ranging from basic physiology to the implementation of nutritional practices in the hospital as well as in the home setting. Papers discuss the morbidity and mortality caused by malnutrition, the nutritional requirements as well as beneficial effects on the gut of enteral nutrition, the noncaloric benefits of fibers or nutritional support during cancer treatment. Also considered are nutritional therapy for critically ill patients, perioperative nutritional intervention, management of the metabolic syndrome, the biological value of protein, the benefits and hazards of parenteral nutrition in patients with intestinal failure, and the role of nutrition in frailty of aged people.

Now in paperback, the second edition of the Oxford Textbook of Critical Care addresses all aspects of adult intensive care management. Taking a unique problem-orientated approach, this is a key resource for clinical issues in the intensive care unit.

The purpose of this book is to bring together the latest findings on metabolic disorders that are strongly implicated in various critically ill patients. Since the beginning of the 20th century, maintaining the "milieu intérieur" has been a major challenge for intensivists. In addition to considerable technological developments in intensive care units, important advances in our understanding of metabolic disorders observed in critically ill patients have been made during the 10 last years. Today, the intensivist can't ignore these disorders when selecting the most appropriate treatment for an illness. Cellular metabolic abnormalities are responsible for systems and organ failures, so the modern approach of organ dysfunctions now includes prevention or treatment of such disorders. This book is a comprehensive tool, allowing the physician to understand, diagnose and treat these metabolic disorders. Water, electrolyte, acid-base, glycemc and endocrinologic problems, as well as metabolic abnormalities observed in renal, cerebral and hepatic failure are presented in different chapters. The last part of the book is devoted to modern nutritional concepts, the consequences of energy modifications, mitochondrial dysfunction, hypothermia, oxidative stress and ischemia reperfusion, which open the way for new therapies.?
