With its many beautiful colour pictures, this book gives fascinating insights into the unusual forms and behaviour of matter under extremely high pressures and temperatures. These extreme states are generated, among other things, by strong shock, detonation and electric explosion waves, dense laser beams, electron and ion beams, hypersonic entry of spacecraft into dense atmospheres of planets, and in many other situations characterized by extremely high pressures and temperatures. Written by one of the world's foremost experts on the topic, this book will inform and fascinate all scientists dealing with materials properties and physics, and also serve as an excellent introduction to plasma-, shock-wave and high-energy-density physics for students and newcomers seeking an overview.

Aristotle's views on the fundamental nature of reality are usually taken to be inconsistent. The two main sources for these views are the Categories and the central books of the Metaphysics, particularly book Zeta. In the early theory of the Categories the basic entities of the world are concrete objects such as Socrates: Aristotle calls them 'primary substances'. But the later theory awards this title to the forms of concrete objects. Michael Wedin proposes a compatibilist solution to this long-standing puzzle, arguing that Aristotle is engaged in quite different projects in the two works. The theory of Metaphysics Zeta is meant to explain central features of the standing doctrine of the Categories, and so presupposes the essential truth of the early theory. The Categories offers a theory of underlying ontological configurations, while book Zeta gives form the status of primary substance because it is primarily the form of a concrete object that explains its nature, and this form is the substance of the object. So when the late theory identifies primary substance with form, it appeals to an explanatory primacy that is quite distinct from the ontological primacy that dominates the Categories. Wedin's new interpretation thus allows us to see the two treatises as complementing each other: they are parts of a unified history of substance.

Why do literary theorists see reading as an act of dispassionate textual analysis and meaning production, when historical evidence shows that readers have often read excessively, obsessively, and for sensory stimulation? Posing these and other questions, this is the first major work to bring insights from book history to bear on literary history and theory. In so doing, the book charts a compelling and innovative history of theories of reading. While literary theorists have greatly contributed to our understanding of the text-reader relation, they have rarely taken into account that the relation between a book and a reader is also a relation between two bodies: one made of paper and ink, the other flesh and blood. This is why, Karin Littau argues, we need to look beyond the words on the page, and pay attention to the technical innovations in the physical format of the book. Only then is it possible to understand more fully how media technology has changed our experience of reading, and why media history presents a challenge to our conceptions of what reading is. Each chapter places the reader in specific disciplinary and historical contexts: literature, criticism, philosophy, cultural history, bibliography, film, new media. Overall, the history recounted in this book points to a split between modern literary study which regards reading as a reducibly mental activity, and a tradition reaching back to antiquity which assumed that reading was not only about sense-making but also about sensation. Theories of Reading: Books, Bodies and Bibliomania will be essential reading for all students and scholars of literary theory and history as well as of great interest to students of the history of the book and new media.

The Physics is a foundational work of western philosophy, and the crucial one for understanding Aristotle's views on matter, form, essence, causation, movement, space, and time. This richly annotated, scrupulously accurate, and consistent

translation makes it available to a contemporary English reader as no other does—in part because it fits together seamlessly with other closely associated works in the New Hackett Aristotle series, such as the Metaphysics, De Anima, and

forthcoming De Caelo and On Coming to Be and Passing Away. Eventually the series will include all of Aristotle's works. Sequentially numbered endnotes provide the information most needed at each juncture, while a detailed Index of Terms

indicates places where focused discussion of key notions occurs. An illuminating general Introduction describes the book that lies ahead, explaining what sort of work it is and what sorts of evidence it relies on.

Focusing on the medieval reception of Book Zeta of Aristotle's Metaphysics, Volume One of this work offers an unprecedented and philosophically oriented study of medieval ontology against the background of the current metaphysical debate on

the nature of material objects. Volume Two makes available to scholars one of the culminating points in the medieval reception of Aristotle's metaphysical thought by presenting the first critical edition of Book VII of Paul of Venice's Commentary on

Aristotle's Metaphysics (1420-1424)."

In this highly original study, David Gillis demonstrates that the Mishneh torah, Maimonides' code of Jewish law, has the structure of a microcosm. Through this symbolic form, Maimonides presents the law as designed to

perfect the individual and society by shaping them in the image of the divinely created cosmic order. The commandments of the law thereby bring human beings closer to fulfilling their ultimate purpose, knowledge of God.

This symbolism turns the Mishneh torah into an object of contemplation that itself communicates such knowledge. In short, it is a work of art. Gillis unpacks the metaphysical and cosmological underpinnings of Maimonides'

scheme of organization with consummate skill, allowing the reader to understand the Mishneh torah's artistic dimension and to appreciate its power. Moreover, as he makes clear, uncovering this dimension casts new light

on one of the great cruxes of Maimonides studies: the relationship of the Mishneh torah to his philosophical treatise The Guide of the Perplexed. A fundamental unity is revealed between Maimonides the codifier and

Maimonides the philosopher that has not been fully appreciated hitherto. Maimonides' artistry in composition is repeatedly shown to serve his aims in persuading us of the coherence and wisdom of the halakhic system.

Gillis's fine exegesis sets in high relief the humane and transcendental purposes and methods of halakhah as Maimonides conceived of it, in an argument that is sure-footed and convincing.

Adriel M. Trott challenges the wholesale acceptance of the view that nature operates in Aristotle's work on a craft model, which implies that matter has no power of its own. Instead, she argues for a robust sense of matter in Aristotle in response to feminist critiques. She finds resources for

thinking the female's contribution - and the female - on its own terms and not as the contrary to form, or the male.

State immunity, the idea that a state, including its individual organs, officials and other emanations, may not be proceeded against in the courts of another state in certain instances, has long been and remains a source of

international controversy. Although customary international law no longer recognizes the absolute immunity of states from foreign judicial process, the evolution of the contemporary notion of restrictive state immunity

over the past fifty years has been an uncoordinated and contested process, leading to disputes between states. The adoption, in 2004, of the United Nations Convention on Jurisdictional Immunities of States and Their

Property has significantly contributed to reaching consensus among states on this fundamental question of international law. This book provides article-by-article commentary on the text of the Convention, complemented

by a small number of cross-cutting chapters highlighting general issues beyond the scope of any single provision, such as the theoretical underpinnings of state immunity, the distinction between immunity from suit and

immunity from execution, the process leading to the adoption of the Convention, and the general understanding that the Convention does not extend to criminal matters. It presents a systematic analysis of the Convention,

taking into account its drafting history, relevant state practice (including the considerable number of national statutes and judicial decisions on state immunity), and any international judicial or arbitral decisions on point.

Aristotle's Metaphysics 2 consists of two chapters on methodology flanking an important discussion of the impossibility of infinite causal chains. The subject is vital for scientific method and for theological belief in a first

cause and in a beginning of the universe. Philoponus later attacked Aristotle on this last point, but Alexander presents Aristotle's view in a most favourable light. In Metaphysics 3, Aristotle sets out what he sees as the

central problems of metaphysics. Alexander's commentary was subsequently used by the Neoplatonists, two of whom have left their own commentaries, so that Alexander's Aristotelian interpretation can be compared with

its rivals.

Being and Ambiguity is a brilliant work of philosophy, filled with insights, jokes, and topical examples. Professor Ziporyn draws on the works of such Western thinkers as Wittgenstein, Nietzsche, Freud, Sartre, and Hegel, but develops his main argument from Tiantai school of

Chinese Buddhism. This important work introduces Tiantai Buddhism to the reader and demonstrates its relevance to profound philosophical issues. Ziporyn argues that we can make both of the claims below simultaneously: This book is about everything. It contains the answers to all

philosophical problems which ever shall exist. This book is all claptrap. It is completely devoid of objective validity of any kind. These claims are not contradictory. Rather, they state the same thing in two different ways. To be objective truth is to be subjective claptrap, and vise

versa. All interchanges of any kind - conversations, daydreams, sensations - are not only about something but also about everything. Thus, this book concerns itself with no less than the nature of what is and what it means for something to be what it is. It provides a new approach to

the basic Western philosophical and psychological issues of identity, determinacy, being, desire, boredom, addiction, love and truth.

In Form, Matter, Substance, Kathrin Koslicki develops a contemporary defense of the Aristotelian doctrine of hylomorphism. According to this approach, objects are compounds of matter (hule) and form (morphe or eidos) and a living

organism is not exhausted by the body, cells, organs, tissue and the like that compose it. Koslicki argues that a hylomorphic analysis of concrete particular objects is well equipped to compete with alternative approaches when measured

against a wide range of criteria of success. However, a plausible application of the doctrine of hylomorphism to the special case of concrete particular objects hinges on how hylomorphists conceive of the matter composing a concrete

particular object, its form, and the hylomorphic relations which hold between a matter-form compound, its matter and its form. Koslicki offers detailed answers these questions surrounding a hylomorphic approach to the metaphysics of

concrete particular objects. As a result, matter-form compounds emerge as occupying the privileged ontological status traditionally associated with substances due to their high degree of unity.
