When a customer makes a purchase using a cryptocurrency as payment, the transaction often passes a fixed exchange rate through the payment gateway. It translates immediately to commonly accepted fiat currency so that the merchant can escape the cryptocurrency market instability. Cryptocurrency payment has several advantages, such as improved transactional security, fraud protection, decentralized framework, low fees, customer chargeback protection, and rapid international transfers. Throughout history, we've used different mediums of exchange like commodity money, paper money, gold standard, fiat currencies etc. Different scientific communities across the world have been dissatisfied with the short-comings of these traditional currencies. Due to the explosion of internet and progress made in the fields of cryptography, online security, and digital payments, it became possible to have a decentralized currency that could void the necessity of a central bank or government. The first modern cryptocurrency to emerge that is effective and used widely is Bitcoin. A white-paper explaining the details of bitcoin implementation was first published under the pseudo-name of Satoshi Nakamoto in October 2008. The paper is titled "Bitcoin: A Peer-to-Peer Electronic Cash System" and can be downloaded at [www.bitcoin.org/bitcoin.pdf](http://www.bitcoin.org/bitcoin.pdf). On January 2009, Satoshi released the initial version of the bitcoin software on SourceForge.net, opening the technology up to the public. *Competition, the drive for efficiency, and continuous improvement ultimately push businesses toward automation and later towards autonomy. If a business can operate without human intervention, it will minimize its operational cost. If Uber can remove the expense of a driver with an autonomous vehicle, it will provide its service cheaper than a competitor who can't. If an artificially intelligent trading company can search, find, and take advantage of some arbitrage opportunity, then it can profit where its competitors cannot. A business that can analyze and execute in real-time without needing to wait for a human to act, is a business that will be able to take advantage of brief inefficiencies from other markets or businesses. This trend following a thesis that is based on 100 years of proven economic theory. Short-wave economic cycles, those 5- to 10-year cycles, are driven by credit but the long-wave economic cycles, those 50- to 60-year cycles, are driven by technological revolution. We've had 5 cycles over the past 200 years with the last wave, the Age of Information & Telecommunications. We've seen evidence that a new cycle has begun. Technological revolutions come by way of a cluster of new innovations. About a decade ago, you started to see AI, robotics and IoT (sensors) delivering on automation. That's been powerful, but not transformational. It does not force businesses to fundamentally change how they do business. The last piece of the puzzle was cryptocurrency because it allows us to process and transfer economic value without human intervention. Soon, there will be a global race to build autonomous operations. Businesses and organizations without autonomous operations simply will not be able to compete with those that do because ... autonomy is the ultimate competitive advantage. Crypto is the mechanism that will accrue value from being the infrastructure for the next*
