TEXT WITH CD STUDY GUIDE With a focus on the relatedness of immunology and microbiology, Immunology, Infection, and Immunity covers both the foundation concepts of immunology, among the most exciting in modern biology and medicine, and their application to the real world of diseases and health. This new text combines clear narratives of how the immune system functions relying in many instances on supporting data from experiments. The editors use examples and illustrations depicting basic immunologic processes in conjunction with their role in infectious or other diseases in order to teach both basic and applied aspects of immunology. A chapter on antibody-antigen interactions and measurements of immunologic reactions familiarizes students with the tools of experimental immunology. In addition to an emphasis on infectious diseases, the book focuses strongly on those areas where the immune system does not act when it should – primary and acquired immunodeficiency, and the failure to control cancer – as well as areas where the over-activity or dysregulation of the immune system is a cause of pathology – hypersensitivity reactions, including allergy and asthma, autoimmunity and the unwanted immune responses to transplanted tissues and organs. To bring the full flavor and excitement of immunology to new students, the editors have assembled an outstanding group of contributors with expertise in the multiple areas of immunology who provide the most up-to-date information in this quickly moving field. All of the chapters have standardized thematic and structural aspects to provide critical information in a comprehensive style. Immunology, Infection, and Immunity is ideally suited for upper division and graduate level students as well as medical and dental students with a good background in basic biology, biochemistry, genetics, and cell biology. The text complements traditional views and dogmas about immunology with today's cutting edge ideas and experimental data describing how the immune system works, some of which are challenging and changing some long-held beliefs about the function of the immune system. Key Features Examines the basic molecular and cellular components of the immune system relative to the pathogenesis and prevention of infectious diseases Concentrates on the way in which the immune system is critical to the pathogenesis and prevention of infectious diseases Focuses on primary and acquired immunodeficiency and immune system dysregulation as causes of pathology Contributions from multiple areas of immunology present current information in a rapidly moving field All chapters have standardized thematic and structural aspects to provide critical information in a comprehensible style Examples and illustrations depict basic immunologic processes in conjunction with their role in infectious or other diseases About the Electronic Study Guide The DLG CD—ROM is an interactive, automated program that organizes each chapter from Immunology, Infection and Immunity into questions, answers, and extensive explanations. The software helps students first through reviewing the book and then helps them quiz themselves and assess their progress. Clinical Communication Skills for Medicine is an essential guide to the core skills for effective patient-centered communication. In the twenty years since this book was first published the teaching of these skills has developed and evolved. Today's doctors fully appreciate the importance of communicating successfully and sensitively with people receiving health care and those close to them. This practical guide to developing communication skills will be of value to students throughout their careers. The order of the chapters reflects this development, from core skills to those required to respond effectively and compassionately in challenging situations. The text includes case examples, guidelines and opportunities to encourage the reader to stop and think. The contents of the book cover: The fundamental elements of clinical communication, including skills for effectively gathering and sharing information, discussing sensitive topics and breaking bad news. Shared decision making, reflecting the rapid changes in expectations of medical care and skills for supporting patients in making decisions which are right for them. Communicating with a patient's family, children and young people, patients from different cultural backgrounds, communicating via an interpreter and communicating with patients who have a hearing impairment. Diversity in communication, including examples of communicating with patients who have a learning disability, transgender patients, and older adult patients. Communicating about medical error, emphasising the importance of doctors being honest in the face of difficult situations. This is a practical guide to learning and developing communication skills throughout medical training. The chapters range from the development of basic skills to those dealing with challenging and difficult situations.

Within this one volume both basic science and clinical immunology are demystified for the medical and other health sciences student. The basic immunological processes are described first, with a level of detail restricted to what is appropriate for medical (and similar) curricula. In the second part of the book,

immunological mechanisms behind major diseases of the various body systems are explained. Throughout the text clinical details are highlighted and more in-depth material is differentiated from the main text.
