Engaging and lively, clear and practical, this is the most applied accounting for non-specialists book whose fully integrated case study emphasises the relevance of accounting to the world of business. Sam Smart is the budding entrepreneur who forms the basis of the case study at the heart of this book. We follow Sam as he goes from starting a small business, printing sports kits for local teams, to managing a global sports business. Throughout the course of the book he assesses the success of his business, finances day to day activities, makes pricing decisions, opens new branches, looks at cash flow, and facilitates planning, control, and investment. Featured at the start of every chapter to highlight to students the implications and applications of the topic they are about to study, Sam and his business provide consistency and connection. As we follow the case study, all the topics central to accounting are covered with clarity, imagination, and relevance, giving students the support they need to complete their course and exams with confidence. The wealth of additional examples and self-test exercises available alongside the case study enable students not only to develop an appreciation of how accounting information allows a manager to make key business decisions, but also to acquire the skills necessary to enable them to converse with accountants, and challenge their assumptions and methodologies.

Get the database skills that are in demand More and more organizations are turning to database management systems to manage their accounting and other operational data. These organizations are looking for accountants with database skills and a good understanding of information technology. With Chang and Ingraham's Data Modeling and Database Design: Using Access to Build a Database you can develop the skills needed to build an actual accounting information system. Taking an approach that is both conceptual and practical, this book will help you understand the theory of data modeling, as well as its application and ultimate implementation in database design. Key Features: Step-by-step detailed instructions show how to model and design three essential processes of an accounting information system: the sales/collection process, the acquisition/payment process, and the human resources/payroll process. Presents data modeling from an REA (resource-event-agent) perspective. The approach is software-independent, but utilizes Microsoft Access 2003 to implement the data models throughout the text. Multiple-choice and detailed problems at the end of each chapter reinforce learning. Includes a CD-ROM containing the additional data and forms you will need to complete each chapter.
