

## Accounting Information Systems Seventh Edition Test Questions

*For introductory undergraduate courses in Information Systems taught in MIS, IS, CIS, Business and Management departments. This brief text is ideal for courses on quarter systems and those that combine a MIS text with hands-on software, projects, or case studies. These authoritative authors continue to define the MIS course by emphasizing how business objectives shape the application of new information systems and technologies and integrating a career orientation that demonstrates the relevance of information systems to all business students regardless of their major.*

*Introduction to Information Technology second edition is based on the fundamental premise that the major role of information technology (IT) is to support employees, regardless of their functional area (e.g. sales, marketing, accounting, HR) or level in the organization. The unique theme of "What's in IT for me/ IT's About Business" provides relevance for majors and non-majors. The text takes a hands-on approach with the popular Virtual Company, has strong coverage of e-commerce, an excellent variety and volume of examples, a strong website with real world applications and cases, and a presentation that makes the material accessible through an attractive design. The text shows IT through a global perspective and emphasizes the importance of making connections among individuals, groups and organizations. The text is ideal for undergraduate business majors with no prerequisite computer courses, and the new edition builds upon the advantages of the previous edition by further tying the text together with the online material.*

*This textbook is intended to meet the needs of a first course in accounting information systems at either the undergraduate or graduate level. It may also be used as a review text in second or subsequent courses in this area. A primary objective in writing the seventh edition of the text was to present AIS material that would make students more marketable in today's accounting environment. Recognizing that over 90 percent of accounting systems are licensed rather than internally custom developed and that the current market demand is for accounting graduates who can install, operate, and audit such systems, this text represents a new paradigm. In contrast to traditional accounting systems textbooks that assume an organization will develop its own accounting system and, therefore, emphasize systems development, this textbook gives students the theoretical foundation and skills they will need to conduct a requirements analysis, search for a commercial solution, and successfully implement the software package selected. In addition to learning the essential AIS concepts, you will see much discussion and many examples of commercial accounting systems software as it is designed and as it should be designed. Another objective in writing this edition was to make the material student friendly. Therefore, the authors took great care in directing their words to the students. Recognizing that this is their first introduction to accounting systems, clear definitions of terms were included and numerous examples and illustrations were incorporated to explain the material. The book consists of fifteen chapters. The first fourteen chapters provide the theoretical and practical foundation for the final chapter on selecting and implementing AIS software. The learning experience will be optimized if all fifteen chapters are covered.*

ACCOUNTING INFORMATION SYSTEMS, 7E helps you develop the necessary skills and solid foundation in enterprise risk management as it relates to business processes and their information systems. The book's proven coverage centers around three of the areas most critical in accounting information systems today--enterprise systems, e-Business systems, and controls for maintaining those systems--with icons that direct your attention to the most important information. Inhaltsangabe:Abstract: The world economy has undergone enormous changes since the late 1980s. The trend of globalisation has more and more integrated societies and linked continents with one another. The result has been the development of free trade areas such as NAFTA (North American Free Trade Area), the EU customs union, and emerging markets in Asia. Countries had to cope with this development of a near free market economy and higher competition. Governments introduced new laws and regulations and great reforms and adjustments had to be made. The effects of the above led to great impacts on general business and the entire world economy. Companies started to enter new markets. To link all its facilities and office buildings and factories, the Intranet was established. With such an efficient LAN network, all the offices of a worldwide operating organization were linked with the central computer system of the company s headquarters and data and information was easily accessible. At the same time, PC users discovered the Internet leading to a worldwide revolution and to the so-called Information Age. The Internet has experienced tremendous growth during the last few years in the western world and companies started to introduce their own web sites on the Internet. Basically, everyone had access to these company sites and firms started to advertise themselves and to offer their products and services online and developed new marketing concepts in the e-commerce business. At the same time the telecommunication industry was booming. Online providers and mobile telecommunications companies experienced fast and significant growth due to the World Wide Web, deregulation and lower prices. The New Economy was born and companies came into existence like Yahoo! and Amazon.com, and so many more creating millions of new high-tech jobs, especially in the United States and later on also in Europe. Demand for personal computers and servers have increased dramatically. The hardware needed had to be provided, which created another boom in the industry. Chipmakers like Intel and AMD became successful global players and new technologies were introduced at an ever-faster speed. At the same time the global economy brought up new start up companies onto the market, which are producing other important components of computers like modems and video and networking cards and high speed cables. Software companies introduced new programs needed, creating new high-income [...]
