Entrepreneurship is a powerful attitude that, in such a way, in the last few years, has become a discipline increasingly transversal to different areas of knowledge. Many times, we think about the things we want such as a good house, a brand new car, a beautiful relationship, a good friendship, and a good way to be in the world. Is that possible that you convert into an entrepreneur? This book shows some examples of that possibility, from simple people to a big organization. In all cases, if you become an entrepreneur, it will be for your taste and pleasure, a means to survive and enjoy the uncertainty, and rejoice that you have all these in your hands and will. Can you find out the trends and overcome the challenges? We would say yes. It all depends on whether you want to develop and apply this attitude.

The coastal ocean comprises the semi-enclosed seas on the continental shelf, including estuaries and extending to the shelf break. This region is the focus of many serious concerns, including coastal inundation by tides, storm surges or sea level change; fisheries and aquaculture management; water quality; harmful algal blooms; planning of facilities (such as power stations); port development and maintenance; and oil spills. This book addresses modeling and simulation of the transport, evolution and fate of particles (physical and biological) in the coastal ocean. It is the first to summarize the state of the art in this field and direct it toward diverse applications, for example in measuring and monitoring sediment motion, oil spills and larval ecology. This is an invaluable textbook and reference work for advanced students and researchers in oceanography, geophysical fluid dynamics, marine and civil engineering, computational science and environmental science.

Approaches to Disaster Management regards critical disaster management issues. Ten original research reports by international scholars centered on disaster management are organized into three general areas of hazards and disaster management. The first section includes discussions of perspectives on vulnerability and on evolving approaches to mitigation. The second section highlights approaches to improve data use and information management in several distinct applications intended to promote prediction and communication of hazard. The third section regards the management of crises and post-event recovery in the private sector, in the design of urban space and among the victims of disaster. This volume contributes both conceptual and practical commentary to the disaster management literature.
