

A consummate classic with a fresh approach to pediatric dermatology Children's skin is different. Maturation affects the epidermal barrier, the cutaneous microbiome, adnexal structures, vasculature, and transcutaneous absorption of drugs. The immature skin is more susceptible to pathogens and environmental disruption. Many genetic disorders are either present at birth or manifest early in childhood. Skin diseases thus present differently in children than in adults. Pediatric dermatology has seen significant advances over the last decade, particularly in the field of molecular genetics research, which has furthered our understanding of the pathogenesis of many skin diseases and the development of new approaches to treatment. This fourth edition of the Harper classic provides state-of-the-art information on all aspects of skin disease in children. It covers the diagnosis and treatment of all conditions - both common and rare - with a consistently evidence-based approach. Existing content has been refreshed and fully updated to reflect emerging thinking and to incorporate the latest in research and clinical data - especially at the genetic level. This new fourth edition includes: Greater focus on the genetics behind skin disease, including new genes/genodermatoses, progress in genetic analysis, and stem cell transplants Increased coverage of lasers and other technologies used to treat skin disease More summary tables, learning points, tables of differential diagnosis, and clinical algorithms for diagnosis and management Additional online features, including patient information links and multiple choice questions Harper's Textbook of Pediatric Dermatology delivers crucial clinical insights and up-to-date research information that spans the breadth of the field. As the most comprehensive reference book on this subject available, this revised fourth edition will support and guide the daily practice of both dermatologists and pediatricians across the world.

A significant proportion of skin disease develops rapidly, is highly symptomatic and can be associated with considerable morbidity. While most patients with acute skin disorders are initially seen by primary care services, acute dermatology is also encountered in hospital emergency departments and in dermatology clinics. This comprehensive referenc

Each dermatologist that was board certified after 1992 is required by the American Board of Dermatology to take a recertification exam every ten years. One of the major components of the exam is to be able to identify clinical photographs of approximately 200 skin diseases, and while there are other components to the test, they vary according to subspecialty. However, everyone is required to identify the images, so several months before the exam, the American Board of Dermatology releases a list of the skin diseases that will be tested, but does not provide the images or reveal which ones will appear. Review of Clinical Conditions for the Dermatology Recertification Examination provides a thorough, concise review of clinical images of the specific conditions that the reader will be required to recognize during the American Board of Dermatology recertification test. In addition, concise key clinical features for each image will be provided that will assist the reader in recognizing the clinical images on the examination, enabling them a more efficient way to study for the test without having to look up images online or in a large text book. Written by a board certified dermatologic surgeon who recently took the recertification exam, this book proves indispensable to dermatologists taking the exam or residents who want a quick reference of the clinical appearances of the main conditions generally encountered by a dermatologist.??
