Atlas of Human Anatomy, Volume

One: Osteology, Arthrology, and

Syndesmology Myology,

Seventeenth Edition focuses on

illustrations of the different parts of

bones and muscles. The atlas

shows illustrations of the bone

structures of the femur, sternum,

hip-bone, hands, and feet that are

taken from different perspectives.

The drawings also show the

occipital, temporal, sphenoid, and

frontal bones. The different parts of

the bones are labeled. Sketches of

the parietal, ethmoid, lacrimal, nasal, and zygomatic bones are also presented. For the joints and ligaments, the bone structures of the temporomandibular joints, vertebral column, atlantooccipital and atlantoaxial joints, costovertebral joints, and sternocostal joints are presented. The different parts of the bones are also labeled. The muscles of the head, neck, thorax, and the trunk are also presented. The different parts of the muscles are labeled. Illustrations also show the origins and insertions of the muscles of the head and the upper and lower limbs. The atlas is a vital reference for medical students and practicing physicians and surgeons.

Osteology-Arthrology In the first or
Systematic Anatomy, the several
organs and parts of the body are
considered in a systematic order,
according to their structure, their

connection with each other, and their relation to the purposes of life; while in the second, or Topographical Anatomy, the parts are described in the order of their position or association in any region of the body. The first method is best adapted for the elementary and complete study of the structure Of organs, the second is more immediately useful in the study of particular regions in their relation to Medicine and Surgery. The object Of the present work being mainly to serve as a guide for systematic study, the topographical details will for the most part be included under and combined with the general description Of organs, and only

Circumduction is the movement performed when the shaft of a long bone or a part of a limb describes a cone, the apex of which is placed in or

near the joint at one extremity of the bone, while the sides and base of the cone are described by the rest of the moving part. Rotation signifies movement of a bone round a longitudinal axis without any great change of situation. Gliding is applied to that kind of movement in which the surfaces of adjacent bones are displaced without any marked angular or rotatory motion, as in the movement of articular surfaces over each other in some of the carpal and tarsal articulations, or in the movement of advance and retreat of the lower jaw.
