This book, in contrast with previous research and popular discussions that focus on the productivity of workers, identifies the critical influence of supervisors and engineers as key drivers of productivity differentials. To do so, it analyzes productivity at a Japanese car component plant and its three offshoot plants located in the United States, Thailand, and China and how productivity evolved at these plants from the mid-1990s to the early 2010s. The author's participatory observation approach reveals that productivity and work practices converged to a limited degree over the years at all four plants. Particularly influential are the persistent differences at these plants in the extent to which workers learn how to combine and integrate their production skills with troubleshooting skills. Supervisors play a key role in developing this integration in Japan, while worker skills remain separated in the other countries. Integrated skill development is promoted in Japan through the trusting relationships that first-line supervisors enjoy with their workforce. In the plants abroad, in contrast, the persistence of workers' control over their individual skill development and careers impedes the development of integrated skills. Manufacturing engineers at the Japanese mother plant also play key linking roles, thereby enhancing communications and problem-solving on the shop floor, whereas manufacturing engineers at the US, Thai, and Chinese plants play more limited and compartmentalized roles. As a result, productivity remains high in Japan and lags in the other plants. Surprisingly, Japanese managers remain reluctant to introduce these more productive work practices in the offshoot plants.

Industrial energy systems channel fuels and power into a variety of energy types such as steam, direct heat, hot fluids and gases, and shaft power for compressors, fans, pumps, and other machine-driven equipment. All of these processes impact the environment and are impacted by external energy and environmental policies and regulations. Therefore many environmental management issues are closely related to energy use and efficiency. Applied Industrial Energy and Environmental Management provides a comprehensive and application oriented approach to the technical and managerial challenges of efficient energy performance in industrial plants. Written by leading practitioners in the field with extensive experience of working with development banks, international aid organizations, and multinational companies, the authors are able to offer real case studies as a basis to their method. The book is divided into three main parts: Part one describes Energy and Environmental Management Systems (EEMS) in current use and management techniques for energy and environmental performance improvement. Part two focuses on the engineering aspects of industrial energy management, describing main industrial energy systems and how to analyse and improve their energy performance. Part three is the TOOLBOX on an accompanying website, which contains data, analytical methods and questionnaires as well as software programs, to support the practical application of the methods elaborated on in the first two parts of the book. This book will be a valuable resource to practising energy and environmental management engineers, plant managers and consultants in the energy and manufacturing industries. It will also be of interest to graduate engineering and science students taking courses in industrial energy and environmental management
