Only the best prepared are chosen to start the highly competitive multimillion-dollar training programs that transform aspiring candidates into U.S. military aviators. This fully updated edition of Barron's Military Flight Aptitude Tests provides would-be aviators in all five U.S. armed services with the competitive edge they will need to score their best and maximize their chances of being selected! This book is an effective, full-spectrum resource for officer candidates, ROTC cadets from all services, and current military members. Six full-length practice tests (two per service) with answers and explanations for every question get readers ready for the Air Force Officer Qualifying Test (AFOQT), the Selection Instrument for Flight Training (SIFT), and the Navy/Marine Corps/Coast Guard Aviation Selection Test Battery (ASTB-E). Test overviews and detailed review sections give potential pilots the boost they need to rise to the top of the selection list, and most of the review subjects apply to all three tests. Successful aviation applicants strongly recommend working through every valuable

review section, and the other services' tests are great for extra practice to reinforce your learning. Written by a veteran, joint qualified military officer and instructor, this book's review sections cover language skills, reading comprehension, math knowledge, arithmetic reasoning, mechanical comprehension, aviation and nautical technical information, science, and specific mental skills such as block counting, finding hidden figures, and spatial apperception. The author also coaches readers on effective study techniques, provides expanded information resources, and gives pilot candidates a thorough preview of how each test is structured and conducted.

U.S. Air Force officer candidates, ROTC cadets, and others preparing to take military flight aptitude tests will find the information they 're looking for in this manual. They 'll also find six full-length practice tests with answers and explanations for all questions. That total gives applicants more practice tests than any other flight aptitude manual on the market. The tests are as follows: two practice AFOQT (Air Force Officer Qualifying Tests); two practice AFAST (Army Alternate Flight Aptitude Selection Tests); and two practice ASTB (Navy/Marine Corps/Coast Guard Aviation Selection Test Batteries). This manual also provides general descriptions and overviews of all three tests, plus practice and review questions in all test topics. The topics include language comprehension, mathematics, mechanical comprehension, aviation information, nautical information, general science, and specific mental skills such as block counting, finding hidden figures and complex movements, cyclic orientation, and spatial apperception. The author also gives practical advice on effective study techniques, how to find information resources, and physical preparation.

ASTB Study Guide 2021-2022

The current selection tool used by the U.S. Navy and Marine Corps for its aviation officer program is a paper-and-pencil test that measures academic aptitude. There are no other tests in operational use that measure the psychomotor skills and cognitive processing skills that aviators need to fly. The Naval Aerospace Medical Research Laboratory (NAMRL) is currently evaluating the use of such a test. The purpose of this study was to establish the relationship between the paper-and-pencil Aviation Selection Test Battery that is currently being used and a Computer-Based Performance Test (CBPT). A factor analysis resulted in a four factor model accounting for 66% variance. The four factors measured by the CBPT and ASTB include tracking, quantitative skills, dichotic listening, and spatial abilities. Neither of the test batteries fully loaded on all factors. This indicates that while there are some similarities between the two test batteries (i.e. math skills, spatial apperception), there are also some important differences (e.g. dichotic listening and tracking) between the two test batteries. These differences may prove to be beneficial for future aviation selection tests.

"The purpose of the study was to conduct an initial evaluation of the equivalence between the current paper-and-pencil version of the U.S. Navy's Aviation Selection Test Battery (ASTB) and a Windows-based version of the ASTB"--Abstract.

The U.S. Navy currently uses the Aviation Selection Test Battery (ASTB) to select pilots and naval flight officer candidates prior to their entry into basic flight training. The ASTB began operational use in 1992, and consists of 5 scored paper-and-pencil subtests that are converted to composite scores that are predictive of training performance and attrition. One of these subtests is the Biographical Inventory (BI). The BI is a series of questions on an individual's background and life experiences, and it was originally validated to predict early flight training attritions. Factor analytical studies have shown the 71 item BI to measure traits such as Risk-Taking Behavior, Athletic Orientation, Military Interest, Engineering Background and Independence. Since 1992, an unscored bank of non-cognitive test items, called the Aviation Interest (AI) test, has been administered to all applicants to the Navy's flight training program. The current study evaluated the factor structure of this unscored subtest with the current BI and the incremental validity the AI items might provide using a dichotomous pass/fail criterion. The factor analysis

## Acces PDF Aviation Selection Test Battery Study Guide

showed a large amount of overlap between the items in the AI and BI. However, at least one factor, labeled rebelliousness, was unique to the AI test. Using a horizontal weighting method for individual test item responses, a combined AI/BI test key is proposed to improve the current predictive validity of the ASTB ( $R = .096$ ) and/or replace outdated BI items.

In the well-established aviation system, the importance of sound human factors practice, based on good aviation psychology research, is obvious from those incidents and accidents resulting from its neglect. This carefully structured book presents an up-to-date review of the main areas in the field of Aviation Psychology. It contains current thinking mainly from Europe, but with input from Australia and North America, from specialists involved in research, training and operational practice. Spanning six parts, the book covers: Human Engineering, Occupational Demands, Selection of Aviation Personnel, Human Factors Training, Clinical Psychology, Accident Investigation and Prevention. Looking at the six parts - in human engineering, the reader learns about human-centered automation as well as human factors issues in aircraft certification. Results derived by job analysis methods are presented in the next part and serve as basic information in the design of selection and training programs. In selection, computerized testing or behaviour-oriented assessments are challenging approaches for personnel recruitment. Cost-benefit analyses in selection reveal convincing results, enabling organizations to save huge amounts of

inappropriate training investment by the application of proper selection tests. The NOTECHS method is described which helps to assess CRM capabilities in training and can also be used to measure training effects in systematic validation studies. Although operational personnel in aviation are usually able to cope with stress more efficiently than other occupational groups, individual problems might develop as reactions to traumatic influences. Either a psychological evaluation or a proper treatment or both is then required as described in the 'Clinical Psychology' part of the book. The readership includes: aviation psychologists and flight surgeons, training, selection and recruitment specialists, instructor pilots, CRM facilitators, personnel managers, accident investigators, safety pilots, air traffic controllers, aircraft engineers and those dealing with human-machine interfaces.

These include the 'Altitude Judgment' test, the 'Maneuvers' test, a short-form 'Instrument Comprehension' test, a socioeconomic scale, and ratings of the prestige and security of the aviator's job.***

***The Aviation Selection Test Battery (ASTB) has been the qualifying benchmark for the Naval Aviation since World War II. While it is necessary that test scores effectively select the candidates with the greatest chance for success, the ASTB strides toward increasing diversity while maintaining low attrition. Using archived Student Naval Aviator and Student Naval Flight Officer ASTB subtest scores and Primary Flight Training (PFT) records, this study examined the***

***ASTB's predictive ability with respect performance in PFT. Specifically the study consists of two analyses: 1) determine how well the ASTB could predict majority and minority group performance in primary flight training; and 2) determine how well the ASTB could predict success in each training phase and for the entire sample and select groups. The linear regression analysis successfully fit a significant model for the entire sample and Caucasians, but was unable to produce a significant model for African Americans or Hispanics, as there was insufficient data available for either group. The model, when fitted to the entire dataset, with race as an independent variable, yielded a result where all independent variables were significant. The results from the logistic regression models showed there was evidence that four of the ASTB subtests were significant and positive predictors for the entire sample and Caucasians; but was unable to produce a significant model for African Americans or Hispanics. It is apparent that the small data set for minorities limited this study. Efforts to collect data from personnel records should be conducted to obtain all scores from flight training, so that these groups can be further investigated.***

The purpose of this study is to examine the effects of Aviation Selection Test Battery (ASTB) cutoff scores on racial/ethnic minority applicants to naval aviation. The data were obtained from the Naval Aerospace and Operational Medical Institute in Pensacola, Florida. The data consist of test scores and performance measures for student pilots from 1988 through 1994, including pilots who were selected by both the 1992 ASTB and the previous version of the selection test. The study simulates the effect of a higher cutoff score on the 'Old Test' portion of the data, then relates the findings to what may be occurring under present conditions. The results show that the 'selected' pilots performed at a higher level, but the representation of minority groups declined markedly. The 'deselected' pilots performed at a lower level and experienced higher attrition. The implication

is that the relatively high cutoff score used by the Marine Corps may be improving the overall performance of selected pilots, but it may also be eliminating minority candidates at disproportionate rates. Further study of several options is recommended, including the following: additional selection procedures, intensified recruiting efforts, the use of selective waivers, and adverse impact analysis.
