In 1916, at an unpropitious time, Thomas Wallis founded a new practice, Wallis, Gilbert & Partners, primarily to collaborate with an American company in the design of factories to be constructed of reinforced concrete. Up to this time, the designing of factories was not popular among architects and many manufacturers regarded the employment of an architect as a wanton extravagance. Wallis's move could in this light be seen as a reckless gamble, but the subsequent achievements of him and his partners suggest that his choice had been well considered. They became prolific designers of factories and some of the best known inter-war industrial buildings – Firestone, Hoover, The Gramophone Company, Glaxo Laboratories to name only a

few – were their work. Skinner looks first at the biographical background of Wallis, at the history and organization of the partnership he founded, and at the many factors that contributed to its reputation in the inter-war years. She then offers a perspective on architectural thought and activity in that period, and of the attitudes and influences on factory design. Designs by the partnership for over one hundred factories and factory buildings have been discovered and, at the core of the book is a third chapter which analyses and assesses them under four headings: the early "daylight/masonry" style; the "fancy" factories of the mid-term years of 1927–35; the more sculptural and geometrical "British modern" later works up to 1939; and designs, including overseas commissions, that do not easily fit within the three style groups. Skinner concludes with an evaluation of the philosophy of Wallis, Gilbert & Partners, which was to contribute through the architectural design of factories to the successful pursuit of business by the companies that commissioned them. Although factories have played an influential role in society for more than two centuries, their design has rarely caught the imagination of architectural historians. Their neglect of the field is now being rectified to some extent and this book will contribute to the further stimulation of interest in the architectural history of factories.

The SAGE Handbook of Corporate Governance

The Hancocks of Marlborough

Injection moulding of elastomers for mass produced products, such as those for the automotive industries, is a critical process for rubber product manufacturers. Processing equipment and materials are continuously under development for the application. This conference addressed the advances that have been made. The conference proceedings will be of importance to rubber processors, materials suppliers, compounders and end-users alike. The papers discuss developments that are currently available to optimise production from the injection moulding process along with new techniques, materials and equipment.

This book tells the largely unknown history of the Hancock family of Marlborough. It shows how members of one unique family were responsible for creating the earliest form of mechanized transport in the world, the foundation of the UK rubber industry, and the beginnings of the global information highway.
