*Much has been written about the basic incompatibility of the dominant quantitative research model in psychotherapy and the qualitative preferences of the practitioner community providing psychotherapy. Researchers and clinicians are at odds over the most valuable type of knowledge needed: that emerging from quantitative, experimental research versus that from qualitative, case-based practice, respectively. Recently, a number of emerging research methods have attempted to bridge and integrate these two approaches. Case Studies within Psychotherapy Trials is one such effort and significantly furthers the synergy between them. The volume provides a comprehensive illustration of the "cases-within-trials"*

*(CWT) model of research. Quantitative findings from four randomized clinical trials (RCT) are synthesized with qualitative and quantitative findings from systematic case studies of successful and unsuccessful clients representatively drawn from each RCT. The book opens with the history of dialectic and political controversy in psychotherapy research and recent initiatives to bridge the differing perspectives. The RCT and case study projects follow, each commented on by outside experts. In the final chapter the editors compare and contrast the separate projects and draw insightful, impactful conclusions. By bringing together quantitative, natural scientific perspectives on research and qualitative, interpretative understandings and strategies, the chapter authors demonstrate how practitioners can be meaningfully included in future psychotherapy research. This book will be of great interest to psychotherapy researchers and practitioners and those interested in research methods in the behavioral sciences more generally.*

Psychological assessment has always paralleled the growth of psychology and its specialties, and it is not an overstatement to say that measurement and assessment are the cornerstones of psychology, providing the tools and techniques for gathering information to inform our understanding of human behavior. However, the continued growth and new developments in the assessment literature requires an ongoing examination of the principles and practices of central importance to psychological assessment. *The Oxford Handbook of Child Psychological Assessment* covers all areas of child and adolescent assessment. Leaders in the field summarize and synthesize state-of-the-science assessment theories, techniques, and applications. Placing an emphasis on clinical and psychoeducational assessment issues, chapters explore issues related to the foundations, models, special topics, and practice of psychological assessment. Appropriate as a desk reference or a cover-to-cover read, this comprehensive volume surveys fundamental principles of child assessment, including ability, achievement, behavior, and personality; covers the role of theory and measurement in psychological assessment; and presents new methods and data.

**Written from a developmental perspective, Abnormal Child and Adolescent Psychology is organized around five prominent and recurring themes: the course of normal development proceeds in an orderly and predictable direction; maladaptive behaviors represent deviations from the normal path; maladaptive behavior is represented by a continuum of severity (symptoms, syndromes, disorders) based on the degree to which behaviors deviate from the norm; individual, interpersonal, contextual and cultural factors interact in a reciprocal way to influence normal development and abnormal deviations; theoretical input from diverse perspectives can guide our understanding of underlying processes that precipitate and maintain behaviors and the different developmental pathways that might result. The revision will be divided into 5 sections, all integrating the DSM-5, and will include a new chapter on child maltreatment and self injurious behavior.**

**Christiane Brems, an experienced clinician, supervisor, and educator, presents a metatheoretical yet practical guide to working with children ages 3 to 12 years. She draws heavily on developmental, interpersonal, family systems, and self-psychological schools of thought and integrates the core components of all of these approaches in a clear and concise manner. She stresses the need for intensive assessment to precede conceptualization and treatment planning so that treatment techniques are dictated by the needs of each child and family. Brems has contoured**

**the third edition to meet the practical needs and expectations of students and practitioners. Divided among four sections, the chapters follow the logical development of clinicians, mirroring the natural flow of work with children from the practitioners self-exploration, to learning about special aspects of children (such as diversity and development), to awareness about the special needs and demands of children as related to environmental, legal, and ethical issues. Brems prepares clinicians to discover their own personal traits that may facilitate or hinder their work with children. She walks child therapists and counselors through the initial stages of intake, assessment, and conceptualization. The material on assessment instruments is thoroughly updated; discussions refer to the latest versions of instruments, and if new instruments emerged that meet one of the purposes deemed essential to child treatment, they are included. The text contains case examples, each illustrating a specific therapeutic technique.**
