*Symbiosis, Volume II: Associations of Invertebrates, Birds, Ruminants, and Other Biota focuses on associations involving insects, birds, and terrestrial vertebrates, as well as ectosymbiosis and endosymbiosis. The selection first offers information on insects and their endosymbionts and insect ectosymbiosis. Discussions focus on distribution of endosymbioses in insects; behavior of symbionts during embryogeny; physiological problems of insect symbioses; and miscellaneous insect symbioses. The manuscript also elaborates on ectosymbiosis in wood-inhabiting insects and aquatic insects. The book takes a look at avian symbiosis and intestinal microorganisms of ruminants and other vertebrates, as well as areas in which symbiosis affects birds and biochemical processes in the lower part of the alimentary tract of ruminants and in nonruminants. The selection is a dependable reference for readers interested in the relationships of insects, birds, and terrestrial vertebrates.*

***For the first time, a synthesis on the research work done in Europe on all Bark And Wood Boring Insects In Living Trees (BAWBILT) is presented. As final product of a four-year research project gathering together 100 scientists from 24 countries, the book is the fruit of a real collective synthesis in which all European specialists have participated. It reviews and comments on all the European literature, while considering the biological (trees, insects, associated organisms, and their relationships) and forest management aspects. However, although focused on the European forest, it also compares the available information and interpretations to those concerning similar species in other continents. It ends with propositions of research priorities for Europe. The book is directed to all scientists and students concerned with forest entomology and ecology, as well as to forest managers and all scientific public interested in forest biology.***

Wang has gathered contributions from an impressive cohort of the world's most respected experts on longhorned beetles. Chapters review both basics of cerambycid taxonomy, morphology, and behavior (feeding, reproduction, and chemical ecology), as well as more applied concerns, such as laboratory rearing, pest control, and bio-security. Overall, this volume is a valuable contribution to the literature as a "one-stop shop" for readers seeking a comprehensive overview of longhorned beetles... It represents a tremendous effort on the part of Wang and the authors, and has resulted in a much-needed update to the literature. This volume is the only work of its kind available at this time, and is a valuable addition to the library of any scientist studying wood-boring beetles. - Ann M. Ray, Biology, Xavier University, Cincinnati, Ohio in *The Quarterly Review of Biology*, Volume 94, 2019

There are more than 36,000 described species in the family Cerambycidae in the world. With the significant increase of international trade in the recent decades, many cerambycid species have become major plant pests outside their natural distribution range, causing serious environmental problems at great cost. Cerambycid pests of field, vine, and tree crops and of forest and urban trees cost billions of dollars in production losses, damage to landscapes, and management expenditures worldwide. *Cerambycidae of the World: Biology and Pest Management* is the first comprehensive text dealing with all aspects of cerambycid beetles in a global context. It presents our current knowledge on the biology, classification, ecology, plant disease transmission, and biological, cultural, and chemical control tactics including biosecurity measures from across the world. Written by a team of global experts, this book provides an entrance to the scientific literature on Cerambycidae for scientists in research institutions, primary industries, and universities, and will serve as an essential reference for agricultural and quarantine professionals in governmental departments throughout the world.

Responding to a renewed interest in the growing problem of iodine deficiency worldwide, Drs. Charles Oxnard and Peter Obendorf, along with experienced translator and anatomist John Dennison, take a fresh look at the classic text, *Der endemische Kretinismus*, published in 1936 by Springer. Translated here for the first time into English, this landmark text will be a welcome resource for researchers confronting the problem of iodine deficiency. Oxnard and Obendorf point out that there is very little detailed knowledge or numerical data on cretinism available in the English-speaking world. In addition, highly-renowned Professor Basil S. Hetzel, recently-retired World Health Organization Chairman of the International Council for Control of Iodine Deficiency Disorders, published in 2009 with Dr Chen Zu-pei on the resurgence of iodine deficiency in China. Indeed, throughout the entire developing world there may be as many as two billion people at risk to iodine deficiency; perhaps three quarters of a billion have goiter, and ten million may be cretins. Even in developed countries, iodine deficiency is re-emerging (as in New South Wales in 19% of children) with the result of significantly reduced numbers of gifted children (though this is not cretinism per se). Certain to be of significant interest to a wide range of researchers, health providers and professionals, including government health administrators, this English translation of *Endemic Cretinism* is a major contribution to the literature.

Lebensgeschichte in Objekten

In this volume, 268 species are covered. Many of the genera have caused serious problems in identification, but based on the larger number of specimens illustrated on the 25 colour plates, the species can now be identified much more easily. In additional black and white photos for species which are difficult to identify, differential characters are pointed out with arrows. As in the previously published volumes 1,2 and 4, maps with the European distribution are given with dots for verified specimens. There are photographs of male and female genitalia of all species and this volume also contains a systematic catalogue of the European species including those of the neighbouring regions of North Africa, Macaronesia, Turkey and the Middle East. This is the first volume including genetic information from DNA barcoding which proved to be a useful, additional tool in identification, taxonomy and species delimitation.
