"Theoretical Religion is easy. Even a chimpanzee can get it. What the world needs is Practical Scientific Religion."

"Once upon a time, there was a frog that lived in a well. It was born there and brought up there, and yet was a little, small frog. One day another frog that lived in the sea came and fell into the well. "Where are you from?" "I am from the sea." "The sea! How big is that? Is it as big as my well?" and it took a leap from one side of the well to the other. "My friend," said the frog of the sea, "how do you compare the sea with your little well?" Then the frog took another leap and asked, "Is your sea so big?" "What nonsense you speak, to compare the sea with your well!" "Well, then," said the frog of the well, "nothing can be bigger than my well; there can be nothing bigger than this; this fellow is a liar, so turn him out." This has been the difficulty with religious beliefs all through ages." Is it possible for the civilized human society to see beyond those tiny circles of belief systems? In Search of Divinity

Fighting Cancer describes the Gorter Model, an integrative, nontoxic approach to cancer treatment that mobilizes the immune system. It was developed by Robert Gorter, MD, PhD, who in 1976 recovered from Stage IV testicular cancer by using nontoxic treatment and no chemotherapy or radiation. Based on self-experience, extensive research, and decades of clinical practice, the treatment consists of supporting the immune system using fever therapy (hyperthermia), inoculation with immune cells, the use of the botanical mistletoe (*Viscum album*)—the single most commonly prescribed anti-cancer medication in much of Europe—supportive nutrients, and diet and lifestyle changes. Organized into three parts, *Fighting Cancer* presents a clear overview of the model, the research behind it, and strategies for strengthening natural immunity. Emphasizing stress reduction and minimizing toxic exposure, the authors provide practical guidance for patients: questions to ask doctors after diagnosis and advice for evaluating options, gathering information, and getting second opinions. Included are powerful testimonials from patients—most of whom have outlived their prognosis and, in some cases, achieved complete and sustained remission.

"Unique in its breadth of coverage ranging from historical accounts of drug use to clinical and preclinical behavioral studies, *Psychopharmacology* is appropriate for undergraduates studying the relationships between the behavioral effects of psychoactive drugs and their mechanisms of action"--

*CULTURE AND PSYCHOLOGY*, 6th Edition illustrates how and why culture influences mental processes and behaviors in humans, and is relevant for anyone interacting with people from different cultures. Incorporating current research that

Shame remains at the core of much psychological distress and can eventuate as physical symptoms, yet experiential approaches to healing shame are sparse. Links between shame and art making have been felt, intuited, and examined, but have not been sufficiently documented by depth psychologists. *Shame and the Making of Art* addresses this lacuna

by surveying depth psychological conceptions of shame, art, and the role of creativity in healing, contemporary and historical shame ideologies, as well as recent psychobiological studies on shame. Drawing on research conducted with participants in three different countries, the book includes candid discussions of shame experiences. These experiences are accompanied by Cluff ' s heuristic inquiry into shame with an interpretative phenomenological analysis that focuses on how participants negotiate the relationship between shame and the making of art. Cluff ' s movement through archetypal dimensions, especially Dionysian, is developed and discussed throughout the book. The results of the research are further explicated in terms of comparative studies, wherein the psychological processes and impacts observed by other researchers and effects on self-conscious maladaptive emotions are described. Shame and the Making of Art should be essential reading for academics, researchers, and postgraduate students engaged in the study of psychology and the arts. It will be of particular interest to psychologists, Jungian psychotherapists, psychiatrists, social workers, creativity researchers, and anyone interested in understanding the dynamics of this shame and self-expression.

This book is the second volume of autobiographical essays by distinguished senior neuroscientists; it is

part of the first collection of neuroscience writing that is primarily autobiographical. As neuroscience is a young discipline, the contributors to this volume are truly pioneers of scientific research on the brain and spinal cord. This collection of fascinating essays should inform and inspire students and working scientists alike. The general reader interested in science may also find the essays absorbing, as they are essentially human stories about commitment and the pursuit of knowledge. The contributors included in this volume are: Lloyd M. Beidler, Arvid Carlsson, Donald R. Griffin, Roger Guillemin, Ray Guillery, Masao Ito. Martin G. Larrabee, Jerome Lettvin, Paul D. MacLean, Brenda Milner, Karl H. Pribram, Eugene Roberts and Gunther Stent. Key Features \* Second volume in a collection of neuroscience writing that is primarily autobiographical \* Contributors are senior neuroscientists who are pioneers in the field Biological Psychology is the study of psychological processes in terms of biological functions. A major obstacle to understanding dialogue in the field has always been its terminology which is drawn from a variety of non-psychological sources such as clinical medicine, psychiatry and neuroscience, as well as specialist areas of psychology such as ethology, learning theory and psychophysics. For the first time, a distinguished international team of contributors has now drawn these terms together

and defined them both in terms of their physical properties and their behavioural significance. The Dictionary of Biological Psychology will prove an invaluable source of reference for undergraduates in psychology wrestling with the fundamentals of brain physiology, anatomy and chemistry, as well as researchers and practitioners in the neurosciences, psychiatry and the professions allied to medicine. It is an essential resource both for teaching and for independent study, reliable for fact-checking and a solid starting point for wider exploration.
