Provides the final report of the 9/11 Commission detailing their findings on the September 11 terrorist attacks.

Please note: This is a companion version & not the original book. Sample Book Insights: #1 Flying was expensive in 1972, so most Americans took car trips instead. My parents were no exception. They always took car trips to visit my father's relatives in Indiana. #2 I was 10 years old in 1967, and I was excited to visit Expo 67 in Montreal. My mother, however, was terrified of the bridge collapse and the island sinking, so we didn't go. I was ready to go on my own, and I would fly everywhere. #3 I was 16 years old when I took my first flight in 1973. I was traveling with my friend Nancy. My father drove us the hour to Logan Airport in Boston, where we boarded a plane to Bermuda. I felt a thrill watching my savings account grow. #4 I had ended my junior year by breaking up with my steady boyfriend and vowing to start having a big, exciting life. I convinced my friend Nancy to join me on a trip somewhere, and we flew to Bermuda.

Moses Lake stands out as the "boomtown" of Grant County. A period of exponential growth began in the 1940s as the result of water and air power. Moses Lake sits at the heart of the Columbia Basin Project, a monumental irrigation system controlled by Grand Coulee Dam supplying water to over half a million acres.

Activation of the Moses Lake Army Air Base (later Larson Air Force Base) during World War II added to the population boom of more than 3,600 percent by 1960. Originally barriers to the success of early agriculture, warm summer temperatures and low annual rainfall make Moses Lake an attractive recreational destination for water sports, fishing, and hunting. From the pioneering days of gasoline-powered pump irrigation to the phenomenal success of modern irrigated farms, water has played the pivotal role in Moses Lake's Cinderella story of agricultural empire in an otherwise arid desert.

Most aviation accidents are attributed to human error, pilot error especially. Human error also greatly affects productivity and profitability. In his overview of this collection of papers, the editor points out that these facts are often misinterpreted as evidence of deficiency on the part of operators involved in accidents. Human factors research reveals a more accurate and useful perspective: The errors made by skilled human operators - such as pilots, controllers, and mechanics - are not root causes but symptoms of the way industry operates. The papers selected for this volume have strongly influenced modern thinking about why skilled experts make errors and how to make aviation error resilient.

This book constitutes the post conference proceedings of the 7th International Workshop on Enterprise and Organizational Modeling and Simulation, EOMAS 2011, held in conjunction with CAISE 2011 in London, UK, in June 2011. Enterprises are purposefully designed systems used to fulfill certain functions. An extended enterprise and organizational study involves both analysis and design activities, in which modeling and simulation play prominent roles. The related techniques and methods are effective, efficient, economic, and widely used in enterprise engineering, organizational study, and business process management. The 14 contributions in this volume were carefully reviewed and selected from 29 submissions, and they explore these topics, address the underlying challenges, find and improve on solutions, and demonstrate the application of modeling and simulation in the domains of enterprises, their organizations and underlying business processes.

Whether a trainee is studying air traffic control, piloting, maintenance engineering, or cabin crew, they must complete a set number of training 'hours' before being licensed or certified. The aviation industry is moving away from an hours-based to a competency-based training system. Within this approach, training is complete when a learner can demonstrate competent performance. Training based on competency is an increasingly popular approach in aviation. It allows for an alternate means of compliance with international regulations - which can result in shorter and more efficient training programs. However there are also challenges with a competency-based approach. The definition of competency-based education can be confusing, training can be reductionist and artificially simplistic, professional interpretation of written competencies can vary between individuals, and this approach can have a high administrative and regulatory burden. Competency-Based Education in Aviation: Exploring Alternate Training Pathways explores this approach to training in great detail, considering the four aviation professional groups of air traffic control, pilots, maintenance engineers, and cabin crew. Aviation training experts were interviewed and have contributed professional insights along with personal stories and anecdotes associated with competency-based approaches in their fields. Research-based and practical strategies for the effective creation, delivery, and assessment of competency-based education are described in detail.

Over a decade ago the concept of "design experiments" was introduced because of the belief that many of questions could not be adequately addressed by laboratory-based experiments. Since then, design-based research as a term has grown in popularity and significance. The core manuscripts of this special issue respond to the questions: What constitutes design-based research? Why is it important? What are the methods to carry it out? At the end of this issue, two strong commentaries situate this work and challenge the community with new questions and issues that must be answered if design-based research is going to help advance work in ways that others judge as worthwhile and significant.

QF32 is the award winning bestseller from Richard de Crespigny, author of the forthcoming *Fly!*: Life Lessons from the Cockpit of QF32 On 4 November 2010, a flight from Singapore to Sydney came within a knife edge of being one of the world's worst air disasters. Shortly after leaving Changi Airport, an explosion shattered Engine 2 of Qantas flight QF32 - an Airbus A380, the largest and most advanced passenger plane ever built. Hundreds of pieces of shrapnel ripped through the wing and fuselage, creating chaos as vital flight systems and back-ups were destroyed or degraded. In other hands, the plane might have been lost with all 469 people on board, but a supremely experienced flight crew, led by Captain Richard de Crespigny, managed to land the crippled aircraft and safely disembark the passengers after hours of nerve-racking effort. Tracing Richard's life and career up until that fateful flight, QF32 shows exactly what goes into the making of a top-level airline pilot, and the extraordinary skills and training needed to keep us safe in the air. Fascinating in its detail and vividly compelling in its narrative, QF32 is the riveting, blow-by-blow story of just what happens when things go badly wrong in the air, told by the captain himself.
