The Psychology of Police Deadly Force Encounters: Science, Practice, and Police is a fascinating look into the reality of police work. The author integrates noted theories into a “street-wise” understanding of being a police officer. The focus of this book is on the use of deadly force by officers—a topic of considerable importance. The author discusses the psychosocial aspects of deadly force use, stemming from the individual officer, the situation, organizational influences, and the police culture. Expanding further into social issues, the controversial topic of race and use of deadly force is discussed. This depiction looks at both sides—that of racial victimization and that of the

police—which helps to provide a rather unique perspective on this important issue. Of interest, the author breaks down the different dimensions of cognition as a factor in decision making among police, including the perception of the situation, the action taken depending on that perception, and the role of present and past memory. This will make for a useful training topic to alert officers to the cognitive processes that go into deadly force use—processes that they have the control to change to make a better decision. Next, the book delves into the biological factors that may be involved in police decision making—again where deadly force is involved. The various negative psychological impacts that a deadly force situation may bring about are identified and explained. This book will be useful as a tool for both law enforcement practitioners and researchers to better understand the intricacies of deadly force by the police. For researchers, the book has a multitude of references available for further exploration. It will prove to be a useful guide and reference volume for police managers and supervisors, mental health clinicians, investigators, attorneys, judges, law enforcement educators and trainers, rank and file police officers, including expert witnesses.

This book offers a vision of the future of electricity supply systems and CIGRE's views on the know-how that will be needed to manage the transition toward them. A variety of factors are driving a transition of electricity supply systems to

new supply models, in particular the increasing use of renewable sources, environmental factors and developments in ICT technologies. These factors suggest that there are two possible models for power network development, and that those models are not necessarily exclusive: 1. An increasing importance of large networks for bulk transmission capable of interconnecting load regions and large centralized renewable generation resources, including offshore and of providing more interconnections between the various countries and energy markets. 2. An emergence of clusters of small, largely self-contained distribution networks, which include decentralized local generation, energy storage and active customer participation, intelligently managed so that they operate as active networks providing local active and reactive support. The electricity supply systems of the future will likely include a combination of the above two models, since additional bulk connections and active distribution networks are needed in order to reach ambitious environmental, economic and security-reliability targets. This concise yet comprehensive reference resource on technological developments for future electrical systems has been written and reviewed by experts and the Chairs of the sixteen Study Committees that form the Technical Council of CIGRE.

Refuting essentialist notions of Nenets culture, the author explores the dialogue between reindeer nomads and the surrounding world and shows how global processes and concepts such as culture, property, and market are expressed in local practices. He demonstrates how reindeer nomads move freely between subsistence and commodity production; state-owned and private reindeer; animism, communism, and market relations; and territorial defence and cooperative knowledge of the land. This study makes an original and significant contribution to wider debates about nomadic pastoralism and to anthropological studies of trade, barter, property, and territoriality. Florian Stammler is senior researcher at the Arctic Centre at the University of Lapland in Rovaniemi (Finland).

A "street smart" look at incident management in all its permutations Incident Management Systems (IMS) provide the means by which to coordinate the efforts of individual agencies in order to stabilize an incident and protect life, property, and the environment. Born from the FireScope project of the late 1960s, which was developed in response to the major wildfires that regularly plagued Southern California, these systems have evolved with many similarities and

certain fundamental differences. *Emergency Incident Management Systems: Fundamentals and Applications* contrasts the major forms of Incident Management/Incident Command Systems. The author illuminates these differences and offers a fresh perspective on the concepts on which these systems are founded in order to make them more accessible and user-friendly. Without suggesting major changes in the systems, he bridges the gap between their theoretical and academic foundations and their real-world applications, and makes them more applicable to the professional's daily needs. Timely features of the book include: * An "in the field" point of view * Coverage of incidents of mass destruction * Filled-out sample forms designed to aid professionals in completing reports In post-9/11 America, where incident management has become a national priority-one that must be easily understood and applicable across all emergency systems-this book provides a useful tool for helping today's emergency workers be more informed and more prepared than ever.

A guide to information systems development covers such topics as strategic planning, project planning, requirements modeling, object modeling, output and user interface design, data design, system architecture, security, communication tools, and financial analysis.

This is a print on demand edition of a hard to find publication. Between 1980 and the mid-1990s, the number of specialized gang units (SGU) in law enforcement agencies increased substantially. The rise in SGU coincided with the widespread adoption of community policing (CP). This report examined whether CP and SGU are complementary or conflicting approaches. The research approach consisted of field observation of gang personnel in two CP agencies with SGU: Indianapolis, IN, and San Diego, CA. This report describes the specific types of activities engaged in by SGU -- documenting the time expended by SGU personnel on each. The results suggest that SGU can have an important role in modern policing. There is little evidence that SGU conflict with CU in principle or practice.

The emergence of the Internet of Things (IoT), combined with greater heterogeneity not only online in cloud computing architectures but across the cloud-to-edge continuum, is introducing new challenges for managing applications and infrastructure across this continuum. The scale and complexity is simply so complex that it is no longer realistic for IT teams to manually foresee the potential issues and manage the dynamism and dependencies across an increasing inter-dependent chain of service provision. This Open Access Pivot explores these challenges and offers a solution for the intelligent and reliable management of physical infrastructure and the optimal placement of applications for the provision of services on distributed clouds. This book provides a conceptual reference model for reliable capacity provisioning for distributed clouds and discusses how data analytics and machine learning, application and infrastructure optimization, and simulation can deliver quality of service requirements cost-efficiently in this complex feature

space. These are illustrated through a series of case studies in cloud computing, telecommunications, big data analytics, and smart cities.
