

## Cnc 12th Guide

**When this book was first published in 1991, political ideology had thrust small-firm issues to the forefront of attempts to revitalize the British economy. In the Thatcher years the emphasis had been on individual enterprise and initiative with the number of small firms increasing rapidly. This was reflected in the growth in the number of specialist studies analysis small-firm revivalism. Small Business and Society clarifies the issues and debates that surround the small business and its place in society. In particular, the complex nature of its social role is examined: on the one hand, the entrepreneur can be seen as the innovator exploiting free-market capitalism to strengthen the economy; on the other, employment conditions and industrial relations are said to suffer. Moreover, the growing importance of ‘green’ issues now brings into question the extent to which the small firm benefits the environment. This book will be of interest to students of business and sociology.**

**We never create anything, We discover and reproduce. The Twelfth International Conference on Industrial and Engineering Applications of Artificial Intelligence and Expert Systems has a distinguished theme. It is concerned with bridging the gap between the academic and the industrial worlds of Artificial Intelligence (AI) and Expert Systems. The academic world is mainly concerned with discovering new algorithms, approaches, and methodologies; however, the industrial world is mainly driven by profits, and concerned with producing new products or solving customers’ problems. Ten years ago, the artificial intelligence research gap between academia and industry was very broad. Recently, this gap has been narrowed by the emergence of new fields and new joint research strategies in academia. Among the new fields which contributed to the academic-industrial convergence are knowledge representation, machine learning, searching, reasoning, distributed AI, neural networks, data mining, intelligent agents, robotics, pattern recognition, vision, applications of expert systems, and others. It is worth noting that the end results of research in these fields are usually products rather than empirical analyses and theoretical proofs. Applications of such technologies have found great success in many domains including fraud detection, internet service, banking, credit risk and assessment, telecommunication, etc. Progress in these areas has encouraged the leading corporations to institute research funding programs for academic institutes. Others have their own research laboratories, some of which produce state of the art research.**

**This book examines speculative urban development and new pattern of urban governance in the context of China’s neoliberal turning. By adopting a post-structuralist lens, the book discusses the restless interactions and power relations, hidden behind the restless conflicts, struggles, negotiations and cooperation among multiple stakeholders during state-led and capital-driven land development. This book therefore reveals a state-led benefit distribution mechanism through which stakeholders are actively and passively involved in the renewal process and slowly promote speculative land development projects in continued cooperation and competition.**
