The first edition of *A Guide To Assessments That Work* provided a much needed resource on evidence-based psychological assessment. Since the publication of the first edition, a number of advances have been made in the assessment field and a revised diagnostic system for mental disorders has been introduced. These changes are reflected in the second edition and new chapters have been included to cover the use of evidence-based

It seems as though each day more children are diagnosed with attention-deficit/hyperactivity disorder (ADHD). ADHD causes challenges not only for the patient but also for their parents, siblings, teachers, and other significant people in their lives. They have an increased vulnerability to addiction and crime. Controversially, stimulants are the primary choice for treatment of ADHD in medical management, and the side effects of this long-term pharmacological management has raised many questions. Psychosocial management including parent training, behavior therapy, and educational

inputs are also major components of treatment and should not be ignored. Thus, it is vital to explore the latest best practices for the diagnosis, assessment, and management of ADHD. *New Developments in Diagnosing, Assessing, and Treating ADHD* is a collection of research on innovations in the management of ADHD. While highlighting topics including adolescent care, neurological disorders, and mental health, this book is ideally designed for academicians, clinicians (especially psychiatrists, clinical psychologists, and pediatricians), social workers, psychiatric nurses, rehabilitation centers, researchers, and students interested in the handling of this disorder and the long-term effects and social risk factors associated with treatment.

This book provides, in a single volume,

an extensive, research-based evaluation of the most popular clinical assessment tools as applied in forensic settings. These widely used instruments often require important modifications in their administration and interpretation when used for forensic purposes, and it is vital that the clinician is intimately familiar with their correct application, as well as their limitations. The test instruments included are analyzed by senior figures in the field of psychological assessment who are uniquely qualified to discuss them because they have either had a crucial role in the development of the tests, or they have dedicated their careers to advancing our understanding of these clinical assessment measures. Each chapter begins with a summary of the development of the assessment instrument in its more traditional applications in clinical settings, and

then considers its utilization in forensic settings. The types of forensic issues which have been addressed with that instrument are reviewed, and an illustrative case example is given which reflects the types of uses and limitations of the assessment technique when applied in a forensic context. New in this edition are a chapter on the MMPI-2-RF and separate chapters for the adult and youth versions of the Hare Psychopathy Checklist. Psychologists using assessment instruments in applied forensic settings will find this to be a valuable and practical source of information, as will attorneys wishing to gain an understanding of the application of these psychological assessment approaches in the courtroom.
