The Audio Dictionary is a comprehensive resource, including historical, obsolete, and obscure as well as contemporary terms relating to diverse aspects of audio such as film and TV sound, recording, Hi-Fi, and acoustics. The Third Edition includes four hundred new entries, such as AAC (advanced audio coding), lIp synch, metadata, MP3, and satellite radio. Every term from previous editions has been reconsidered and often rewritten. Guest entries are by Dennis Bohn, cofounder and head of research and development at Rane Corporation, and film sound expert Larry Blake, whose credits include Erin Brockovich and Ocean's Eleven. The appendixes--tutorials that gather a lifetime's worth of experience in acoustics--include both new and greatly expanded articles.

The essays in this volume discuss both the culture of technology that we live in today, and culture as technology. Within the chapters of the book cultures of technology and cultural technologies are discussed, focussing on a variety of examples, from varied national contexts. The book brings together internationally recognised scholars from the social sciences and humanities, covering diverse themes such as intellectual property, server farms and search engines, cultural technologies and epistemology, virtual embar surveillance, peer-to-peer file-sharing, sound media and nostalgia and much more. It contains both historical and contemporary analyses of technological phenomena as well as epistemological discussions on the uses of technology.

Cum Notis Variorum

Winner of the Society for Ethnmusicology's Klaus Wachsmann Award (2006) *Wired for Sound* is the first anthology to address the role of sound engineering technologies in the shaping of contemporary global music. *Wired sound* is at the basis of digital audio editing, multi-track recording, and other studio practices that have powerfully impacted the world's music. Distinctions between musicians and engineers increasingly blur, making it possible for people around the globe to imagine new sounds and construct new musical aesthetics. This collection of 11 essays employs primarily ethnographical, but also historical and psychological, approaches to examine a range of new, technology-intensive musics and musical practices such as: fusions of Indian film-song rhythms, heavy metal, and gamelan in Jakarta; urban Nepali pop which juxtaposes heavy metal, Tibetan Buddhist ritual chant, rap, and Himalayan folkongs; collaborations between Australian aboriginals and sound engineers; the production of "heaviness" in heavy metal music; and the production of the "Austin sound." This anthology is must reading for anyone interested in the global character of contemporary music technology. CONTRIBUTORS: Harris M. Berger, Beverley Diamond, Cornelia Fales, Ingemar Grandin, Louise Meintjes, Frederick J. Moehn, Karl Neunfeldt, Timothy D. Taylor, Jeremy Wallach.

Karlheinz Brandenburg and Mark Kahrs With the advent of multimedia, digital signal processing (DSP) of sound has emerged from the shadow of bandwidth limited speech processing. Today, the main appli cations of audio DSP are high quality audio coding and the digital generation and manipulation of music signals. They share common research topics including percept tual measurement techniques and analysis/synthesis methods. Smaller but nonetheless very important topics are hearing aids using signal processing technology and hardware architectures for digital signal processing of audio. In all these areas the last decade has seen a significant amount of application oriented research. The topics covered here coincide with the topics covered in the biannual work shop on "Applications of Signal Processing to Audio and Acoustics". This event is sponsored by the IEEE Signal Processing Society (Technical Committee on Audio and Electroacoustics) and takes place at Mohonk Mountain House in New Paltz, New York. A short overview of each chapter will illustrate the wide variety of technical material presented in the chapters of this book. John Beerends: Perceptual Measurement Techniques. The advent of perceptual measurement techniques is a byproduct of the advent of digital coding for both speech and high quality audio signals. Traditional measurement schemes are bad estimates for the subjective quality after digital coding/decoding. Listening tests are subject to sta tistical uncertainties and the basic question of repeatability in a different environment.

Fractals in Music is intended for advanced students of music theory, whether individuals, composers, students, or teachers. It is intelligible to anyone having some knowledge of algebra and trigonometry. The many illustrations clarify such concepts as self-similarity and transforms. Book jacket.
