0959503102*

This book is designed to be a physician's guide for those interested in diving and hyperbaric environments. It is not a detailed document for the erudite researcher; rather, it is a source of information for the scuba-diving physician who is searching for answers put to him by his fellow nonmedical divers. Following the publication of *The Underwater Handbook: A Guide to Physiology and Performance for the Engineer* there were frequent requests for a companion volume for the physician. This book is designed to fill the void. Production of the book has been supported by the Office of Naval Research and by the Bureau of Medicine and Surgery, Research and Development Command, under Navy Contract No. N000014-78-C-0604. Our heartfelt thanks go to the many authors without whose contributions the book could not have been produced. These articles are signed by the responsible authors, and the names are also listed alphabetically in these preliminary pages. Every chapter was officially reviewed by at least one expert in the field covered and these reviewers are also listed on these pages. Our thanks go to them for their valuable assistance. We are grateful to Marthe Beckett Kent for editing Chapter III. Our thanks also go to Mrs. Carolyn Paddon for typing and retyping the manuscripts, and to Mrs. Catherine Coppola, who so expertly handled the many fiscal affairs.

This book reviews the existing data on the frequency and distribution of injuries and the factors contributing to injuries in adventure and extreme sports. Further, it suggests injury prevention strategies and provides recommendations for future research.

Providing the first comprehensive compilation of epidemiological data over a range of new age sports considered to be adventurous and extreme, this publication is also the first of its kind to track down all of the major literature associated with the topic. A uniform and evidence-based approach to organizing and interpreting the literature is used in all chapters. All of the sport-specific chapters are laid out with the same basic headings making it easier for the reader to find common information across chapters. Sports physicians, physical therapists, recreation managers, researchers, injury prevention specialists, the adventure and extreme sport industry, and the adventure and extreme sport participants themselves will find the book useful in identifying problem areas in which appropriate preventive measures can be initiated to reduce the risk and severity of injuries. They will also want to use the book as a source for future research related to injuries in adventure and extreme sports.

This volume offers new insight into an important and largely under-examined area of marine leisure and tourism: scuba diving tourism. Knowledge of scuba diving has long been hidden among broad discussions of water-based sports and activities and this focused book aims to shed further understanding and knowledge on this popular international activity. The book examines the current issues central to research into and management of scuba diving Tourism from multidisciplinary perspectives such as health and safety, climate change, policy and regulation and the recreation/leisure context. It further reveals critical management issues of economic, environmental and socio-cultural impacts related to scuba diving tourism which extends to the influence of climate change on the industry's operations and future. This significant volume which conceptualizes the issues surrounding scuba diving tourism now and in the future is written by leading experts in this field and will be valuable reading for all those interested in marine leisure and tourism.

Starbeck served for over 28 years in the U.S. Navy and Marines, and in this fascinating memoir he answers that very question. Follow along as he tells stories of his many adventures travelling the world as an Independent Medical Diver (DMT/IDC) and a tactical medic, and more recently as a surgical nurse and Merchant Marine Medical Service Officer. Read how he dealt with harrowing medical emergencies associated with diving and high pressure conditions from deep ocean dives to the top of 12,000 foot mountains looking for unexploded bombs. On any given day he could be sailing, diving, shooting, or parachuting out of a plane, on duty as a medical corpsman, a boat driver, a marine mammal tech, a dive instructor, a gofer, a chauffeur, and a gardener. Buckle up and enjoy the stories of his incredible adventures.

In the ten years since the third edition of this work, recreational diving has become increasingly available worldwide and commercial diving has consolidated its operational experience at record depths. From continued research there has come a greater understanding of many of the problems associated with the physiological, bio-engineering and medical aspects of exposure to raised environmental pressure. Increased human activity in this unforgiving environment requires a fresh appraisal of the current state of knowledge in this field. An authoritative team of contributors has been assembled to produce a new edition of this established series of scientific and medical reviews. It contains much new material: every chapter has been revised and many have been completely rewritten. The physiological basis of safe diving, the pathogenesis of diving illnesses and the management of diving accidents are all covered, many from the perspectives of new authors, and new chapters include fitness to dive, hyperbaric oxygen therapy and the possible

long-term effects of diving. This volume will be valuable for all divers who wish to be expert in this field and is essential reading for health professionals of every speciality who, at any time, may become involved with divers or diving, in the assessment and prevention of diving related illnesses or in response to a diving accident.

A reference to clinical diving medicine. Written for doctors and paramedics who are responsible for the medical needs of divers both on or under the water, this new edition retains the strengths of its predecessors, with the emphasis still firmly on practical management. It features an improved section on the diving medical examination, changes to chapters on mortality statistics and drowning, new sections on habitat diving, breath-hold diving and technical diving, and many new illustrations.

diseases of diving medicine are all covered in full, as is the latest in types of diving, including indigenous diving, and associated equipment. Each medical disorder is discussed from a historical, etiological, clinical, pathological, preventative and therapeutic perspective in the informative and accessible style that has made previous editions so popular. Vital reading for physicians, paramedics, naval personnel, and diving organizations, those who know the book already will waste no time acquiring this update, while those new to the text will quickly find it a must for the personal library. Considering the increased need to test and develop ventilation both for normobaric and hyperbaric in underwater technology industries (diving equipment, submarines and other underwater facilities, mining, and other relevant industries, this book presents a complete study in the field of normobaric and hyperbaric ventilation. It focuses on development and verification of the research-based mathematical modeling approach for deterministic modeling of ventilation processes, both for objects with open and closed circulation of breathing gas. It also proposes validated analytical models of ventilation processes, and a new type of carbon dioxide emission simulator that was also developed. Features Describes ventilation processes by replacing semi-empirical models with more accurate analytical models. Includes concepts based on deterministic models (cause-and-effect models) based on analytical mathematical model of the ventilation process. Covers both the objects with open and closed circulation of breathing gas, for hyperbaric and normobaric conditions. Summarizes relevant research results and their validation in real conditions and implemented into operational practice. This book is aimed at researchers, professionals, and graduate students in hyperbaric medicine, processing, building ventilation processing, life support system design, shipbuilding, marine engineering, and diving submarine safety.

opportunity to make the corrections and amendments which are inevitable in a practical manual, and also the possibility to make additions which enhance its usefulness. Above all a further edition means that the book has been found to be acceptable to a large number of readers and has a continuing need. This is indeed the case with *Offshore Medicine*, which in its description of the medical aspects of offshore work has provided a unique guide to the occupational health of a new industry. The development of offshore exploration for gas and oil which began in the 1960s created a whole range of related industries. Most attention was focused on the problems of deep diving in the early years because of the great expansion of the diving industry, its technological advances and the high mortality of divers in the early years. Diving, however, is only a fraction of the total endeavour concerned with the offshore industry. The much larger population of workers offshore who man the rigs and barges, toolpushers, helicopter pilots, crane drivers, scaffolders and roustabouts, geologists and so on, are sympathetically described by A. Alvarez in his recent book *Offshore, A North Sea Journey*, and the harsh and difficult conditions in which they often have to work are sometimes forgotten.

This volume follows and updates AN ANNOTATED BIBLIOGRAPHY ON DIVING AND SUBMARINE MEDICINE published by Gordon and Breach, Science Publishers, Inc., in 1971. The time period covered is primarily the calendar years 1970 and 1971. Also included, however, is much material from the calendar years 1968 and 1969 not in the previous publication. A brief analysis of the sources of material precedes the citations and abstracts, which comprise the main section of the volume. The bibliography is followed by a permuted subject index and an author index. Also included, following the indexes, is a micro thesaurus. Although no attempt has been made to do a critical subject analysis, such an analysis could be accomplished through selecting a particular subject, looking up the appropriate key works in the rotated index, identifying the abstracts, analyzing them, obtaining complete copy as desired, and completing the critical review. This volume is the third annotated bibliography on this subject area to be compiled by these authors. The first, published by Gordon and Breach, Science Publishers, in 1971, was entitled AN ANNOTATED BIBLIOGRAPHY ON DIVING AND SUBMARINE MEDICINE. It covered material published during the 1960's. The second volume, entitled UNDERWATER MEDICINE AND RELATED SCIENCES: A GUIDE TO THE LITERATURE, published in 1973 by Plenum Press, covered primarily material published during 1970 and 1971, with some material from 1968 and 1969. The present volume covers material published during 1972 and 1973, but here again some earlier material has been included. The purpose of these annotated

bibliographies is to make available a large proportion of the published material, in abstract form, indexed in such a manner as to make it possible to compile a reasonably complete annotated bibliography on any specific subject area in the field. It is possible thus to learn where the work is being done, by whom, and how extensively. Also, it becomes obvious what areas of research are lacking or inadequate. These specific searches can also form a background of reference material on which to base further research, or from which to write monographs or state-of-the-art surveys. Papers, articles and reports listed here are in most cases readily available.

This books explains, in simple terms, the mechanisms, manifestations, management of decompression illness and suggests some possible prevention strategies.

Covers basic diving physiology; the pathophysiology of decompression sickness; maritime toxicology; assessment of fitness for diving; special considerations for female, elderly, and pediatric divers; diving-related problems in people with pre-existing medical conditions such as pulmonary, cardiac, and neurologic disease, and much more, with new chapters on the kinetics of inert gas, marine poisoning and intoxication, and diabetes and diving.
