Although a great deal of research on ornamental geophytes has been conducted since the beginning of the 1990s, current information has not been comprehensively presented to researchers and horticulturalists. Covering the latest advances in geophytes science, *Ornamental Geophytes: From Basic Science to Sustainable Production* provides up-to-date reviews on geophyte taxonomy, physiology, genetics, production, plant protection, and postharvest biology. Novel approaches to environmentally-friendly, sustainable production and integrated management have stimulated new

research directions, and innovative biochemical and molecular methods have opened new avenues in taxonomy and breeding. In addition to the issues historically associated with traditionally growing countries, the book reviews the development of new production centers in Africa, Asia, and South America. In 20 chapters, this book reflects three main trends in plant science and horticulture: A demand for sustainable and environmentally friendly production Widespread employment of new molecular technologies The globalization of the production and marketing chains Thoroughly modern and in tune with the needs and methods of the geophytes industry, Ornamental Geophytes: From Basic Science to Sustainable Production will benefit not only researchers who have been engaged for years but also new researchers and students who must meet and challenge the existing dogmas. In addition, the information contained in this book is vital to bringing the value of flower bulbs to the worldwide consumers who are the most important and last links in the chain of utilization and profitability of all

ornamental products.

The Physiology of Flower Bulbs

From Basic Science to Sustainable Production

Representing the most comprehensive review of the physiological research conducted on 61 genera of ornamental geophytes, this book covers the basic aspects of world production, horticultural utilization, botanical descriptions and origins, bulb growth and development and flowering, production systems, diseases, insects, plant breeding and the economics related to flower bulbs. This is the first publication to allow access to this research in one single volume, with each genera chapter being outlined in such a manner that any subject area can be readily accessed without reading the entire chapter. Information is also included on genera that have never been comprehensively reviewed. Written by scientists from all over the world, this book aims to provide a basic orientation for any individuals who are unfamiliar with flower bulbs as well as to serve as a comprehensive, quick-reference text.

Foliar Ca sprays significantly reduced the severity of ULN; fourteen daily sprays of 25 mM calcium chloride or calcium nitrate were both effective. Using overhead fans to increase air flow

on the tops of plants significantly reduced both incidence and severity, offering another promising method to control this disorder.
