A practice-based guide to applying the principles of human-centered design to real-world health challenges; updated and expanded with post-COVID-19 innovations. This book offers a practice-based guide to applying the principles of human-centered design to real-world health challenges that range from drug packaging to breast cancer detection. Written by pioneers in the field—Bon Ku, a physician leader in innovative health design, and Ellen Lupton, an award-winning graphic designer—the book outlines the fundamentals of design thinking and highlights important products, prototypes, and research in health design. This revised and expanded edition describes innovations developed in response to the COVID-19 crisis, including an intensive care unit in a shipping container, a rolling cart with intubation equipment, and a mask brace that gives a surgical mask a tighter seal. The book explores the special overlap of health care and the creative process, describing the development of such products and services as a credit card–sized device that allows patients to generate their own electrocardiograms; a mask designed to be worn with a hijab; improved emergency room signage; and a map of racial disparities and COVID-19. It will be an essential volume for health care providers, educators, patients, and designers who seek to create better experiences and improved health outcomes for individuals and communities.

Since the publication of the Institute of Medicine (IOM) report Clinical Practice Guidelines We Can Trust in 2011, there has been an increasing emphasis on assuring that clinical practice guidelines are trustworthy, developed in a transparent fashion, and based on a systematic review of the available research evidence. To align with the IOM recommendations and to meet the new requirements for Clearinghouse of the Agency for Healthcare Research and Quality (AHRQ), American Psychiatric Association (APA) has adopted a new process for practice guideline development. Under this new process APA’s practice guidelines also seek to provide better clinical utility and usability. Rather than a broad overview of treatment for a disorder, new practice guidelines focus on a set of discrete clinical questions. A systematic review of evidence is conducted to address these clinical questions and involves a detailed assessment of individual studies. The quality of the overall body of evidence is also rated and is summarized in the practice guideline. With the new process, recommendations are determined by weighing potential benefits and harms of an intervention in a specific clinical context. Clear, concise recommendations are incorporated into clinical practice, with the goal of improving quality of care. The new practice guideline format is also designed to be more user friendly by dividing information into modules on specific clinical questions. Each module has a consistent organization, which will assist users in finding clinically useful and relevant information quickly and easily. This new edition of the APA’s guidelines developed under the new guideline development process. These guidelines address the following nine topics, in the context of an initial psychiatric evaluation: review of psychiatric symptoms, trauma history, and treatment history; substance use assessment; assessment of suicide risk; assessment for risk of aggressive behaviors; assessment of cultural factors; assessment of the patient in treatment decision making; and documentation of the psychiatric evaluation. Each guideline recommends or suggests topics to include during an initial psychiatric evaluation. Findings from an expert opinion survey have also been taken into consideration in making recommendations or suggestions. In addition to reviewing the available evidence on psychiatry evaluation, each guideline includes recommendations to enhance patient care.

Stories from the ER: a doctor shows how empathy, creativity, and imagination are the cornerstones of clinical care. To be an emergency room doctor is to be a professional listener to stories. Each patient presents a story; finding the heart of that story is the doctor's most critical task. More technology, more tests, and more data won't work if doctors get the story wrong. Empathy, creativity, and imagination are the cornerstones of clinical care. In Tornado of Life, ER physician Jay Baruch offers a series of short, powerful, and affecting essays that capture the stories of ER patients in all their complexity and messiness. Patients come to the ER with lives troubled by scales of misfortune that have little to do with disease or injury. ER doctors must be problem-finders before they are problem-solvers. Cheryl, for example, whose story is a chaos narrative of "and this happened, and then that happened, and then, and then and then and then," tells Baruch she is "stuck in a tornado of life." What will help her, and and what will help Mr. K., who seems like a textbook case of post-combat PTSD but turns out not to be? Baruch describes, among other things, the emergency of loneliness (invoking Chekhov, another doctor-writer); his own (frightening) experience as a patient; the patient who demanded a hug; and emergency medicine during COVID-19. These stories often end without closure or solutions. The patients are discharged into the world. But if they're lucky, the doctor has listened to their stories as well as treated them.

A simple, straightforward, and foolproof proposal for universal health insurance from a noted economist. The shocking statistic is that forty-seven million Americans have no health insurance. When uninsured Americans go to the emergency room for treatment, however, they do receive care, and a bill. Many hospitals now require uninsured patients to put their treatment on a credit card which can saddle a low-income household with unpayably high balances that can lead to personal bankruptcy. Why don't these people just buy health insurance? Because the cost of coverage that doesn't come through an employer is more than many low- and middle-income households make in a year. Meanwhile, rising healthcare costs for employees are driving many businesses under. As for government-supplied health care, ever higher costs and added benefits (for example, Part D, Medicare's new prescription drug coverage) make both Medicare and Medicaid impossible to sustain fiscally; benefits grow faster than the national per-capita income. It's obvious the system is broken. What can we do? In The Healthcare Fix, economist Laurence Kotlikoff proposes a simple, straightforward approach to the problem that would create one system that works for everyone and secure America's fiscal and economic future. Kotlikoff's proposed Medical Security System is not the "socialized medicine" so feared by Republicans and libertarians; it's a plan for universal health insurance. Because everyone would be insured, it's also a plan for universal healthcare. Participants—including all who are currently uninsured, all Medicaid and Medicare recipients, and all with private or employer-supplied insurance—would receive annual vouchers for health insurance, the amount of which would be based on their current medical condition. Insurance companies would willingly accept people with health problems because their vouchers would be higher. And the government could control costs by establishing the values of the vouchers so that benefit growth no longer outstrips growth of the nation's per capita income. It's a "single-payer" plan, but a single payer for insurance. The American healthcare industry would remain competitive, innovative, strong, and private. Kotlikoff's plan is strong medicine for America's healthcare crisis, but brilliant in its simplicity. Its provisions can fit on a postcard and Kotlikoff provides one, ready to be copied and mailed to your representative in Congress.
