This book gives a description of the group of statistical distributions that have ample application to studies in statistics and probability. Understanding statistical distributions is fundamental

Download File PDF Estimated
Year End Distributions For

for researchers in almost all disciplines. The informed researcher will select the statistical distribution that best fits the data in the study at hand. Some of the distributions are well known to

Download File PDF Estimated
Year End Distributions For
Equity Funds

the general researcher and are in use in a wide variety of ways. Other useful distributions are less understood and are not in common use. The book describes when and how to

Download File PDF Estimated
Year End Distributions For
Equity Funds

apply each of the distributions in research studies, with a goal to identify the distribution that best applies to the study. The distributions are for continuous, discrete, and bivariate random variables. In

Download File PDF Estimated Year End Distributions For Equity Funds

most studies, the parameter values are not known a priori, and sample data is needed to estimate parameter values. In other scenarios, no sample data is available, and the researcher seeks some insight

that allows the estimate of the parameter values to be gained. This handbook of statistical distributions provides a working knowledge of applying common and uncommon statistical distributions in

Problem areas identified are: The needs a) to develop curve fitting procedures to estimate flood flow distributions; b) to incorporate precipitation data into frequency analysis procedures; and c) to better

Download File PDF Estimated Year End Distributions For Equity Funds

define flood potentials for ungauged streams. Closely related to the above, it is noted that variables commonly used to estimate flood magnitudes usually do not serve as optimum predictors. Hydrophysical variables are shown to increase the ability to

Download File PDF Estimated Year End Distributions For Equity Funds

estimate flood magnitudes of all frequencies within the Willamette River basin of western Oregon. The major hypotheses tested show that the traditional "regionalization" procedure is not hydrologically sound. The objective herein is to

Download File PDF Estimated Year End Distributions For Equity Funds

regionalize flood distributions by basin parameters. These parameters include climatic variables that are hydrologically meaningful and easy to measure or estimate. Regression equations are developed to estimate the descriptive statistics of each

Download File PDF Estimated Year End Distributions For Equity Funds

stream's flood distribution. The mean of the logarithms of the annual peak flows describes numerically the position of a flood frequency curve. The standard deviation of the logarithms of the peak flows describes numerically the slope of

Download File PDF Estimated Year End Distributions For Equity Funds

the flood frequency curve assuming a log-normal or log Pearson type III distribution. Watershed relief is the strongest estimator of flood distributions for all but the low elevation streams ($R^2 = 56\%$). Relief influences within-basin climatic

Download File PDF Estimated Year End Distributions For Equity Funds

variability. Large flood climatology differences yield desynchronized runoff from the various source areas. Only rarely do the different elevation areas synchronize and then they yield exceptionally large peak flows. Antecedent conditions are shown to

Download File PDF Estimated Year End Distributions For Equity Funds

be related to flood distributions. Those basins with large year-to-year differences in antecedent conditions have steeper flood frequency curves ($R^2 = 76\%$). Precipitation zones, soil permeability, and forest cover all influence antecedent conditions.

Download File PDF Estimated Year End Distributions For Equity Funds

Drier basins with permeable soils and forest cover have steeper flood frequency curves. Lakes and ponds act as sinks on all peak flows, and streams which flow through them have less steep flood frequency curves. In combination with

Download File PDF Estimated Year End Distributions For Equity Funds

watershed relief and mean annual precipitation, these three variables explain 86% of the stream-to-stream differences in the slopes of flood frequency curves in the Willamette River basin. Drainage area, terrain roughness, forest cover, and

Download File PDF Estimated Year End Distributions For Equity Funds

precipitation explain over 95% of the stream-to-stream differences in average flood magnitudes. Steeper slopes yield larger flood peaks as does lesser forest cover. As elevation increases, average flood magnitudes decrease, but extreme peak flows are

Download File PDF Estimated Year End Distributions For Equity Funds

larger. Collectively these estimation equations reduce standard errors of 50-year floods from over 40% to less than 14%. They also reduce standard errors of ten-year and 25-year floods from 46% to 15%. Methodological procedures of the

Download File PDF Estimated Year End Distributions For Equity Funds

theory of estimation of statistical parameters of time series and their application to hydrology and water engineering, particularly the sphere of reservoir-controlled runoffs, are dealt with in this volume. For estimates use is made of random

sequences generated for various probability properties. This methodological approach enables examination of the properties of random and systematic errors of the parameters estimated even for the asymmetrical probability
