THE ESSENCE OF ANTHROPOLOGY features an experienced and diverse author team with expertise in all subfields of anthropology. With an eye to visual and written clarity, the authors present anthropology from an integrated, holistic perspective. that highlight the integration of human culture and biology in the steps humans take to meet the challenges of survival; and the emergence of globalization and its disparate impact on peoples and cultures around the world. Pedagogical elements support these main themes and give deeper insight into the meaning and relevance of a wide range of topics covered in the general narrative by tying examples to behavior today. Insightful questions foster critical thinking, additional Visual Counterpoints widen the book's array of compare-and-contrast examples, and a new Digging into Anthropology feature provides a hands-on approach to anthropological methods by giving active learning opportunities related to

Drawing on a wide array of sources—personal accounts, medical records, popular magazines, medical journals, and beauty guides—Haiken reveals how our culture came to see cosmetic surgery as a panacea for both individual and social problems.

Dubious Equalities and Embodied Differences explores cosmetic surgery as a cultural phenomenon of late modernity.

From its onset as a medical specialty at the end of the nineteenth century, cosmetic surgery has been intimately linked to discourses of 'normalcy,' as well as to gender, race, and other categories of difference that have shaped its technologies and techniques, its professional ideologies, and the objects of its interventions. Davis considers how cosmetic surgery is taken up in representations of cosmetic surgery in medical discourse and in popular culture,

drawing on a wide range of cultural manifestations including televised 'infotainment,' popular music, performance art, surgeon biographies, stories of patients, public debates, and medical texts. Davis critically engages with the notion of cosmetic surgery as a neutral technology and shows how it is implicated in the surgical erasure of embodied difference.

The book offers a thorough description of rhinoplasty techniques for patients from the Mediterranean area. Noses come in different shapes and colors, depending on the various biotypes of the different geographic regions. This represents a topical issue for rhinoplasty surgeons, since

different nasal morphologies imply different anatomic conditions. Moreover, beauty ideal varies from one region to the other, and those differences need to be taken into consideration. Based on these premises, the ethnic rhinoplasty is becoming more and more important among facial plastic surgeons. In order to broaden the understanding of anatomic-functional and cultural or cosmetic aspects specific to the Mediterranean nasal biotype, the book collects and discusses the experiences of surgeons operating on patients from the various regions of the Mediterranean area. Mediterranean Rhinoplasty represents a valuable resource not only for surgeons who are already

own nasal characteristics, which need to be considered when planning rhinoplasty surgery. This book is probably the first of its kind in the Indian context highlighting the goal of maintaining ethnic identity congruent with the patient's facial features and establishing Indian standards for gauging the success of the surgery. This is important as most of the rhinoplasty books have addressed these issues of the Caucasian or southeast Asian population and Caucasian normative standards of facial analysis. This book provides a broader understanding of ethnically specific features. It highlights

the regional variations within India and their implications for rhinoplasty Surgery, thereby filling the void of lack of knowledge of the intricacies of surgery on Indian noses. It deals with important topics such as preoperative evaluations, determining factors such as thickness and texture of skin along with the various complications that may be encountered. It simplifies and facilitates learning with numerous pre-operative, intra-operative, and postoperative photographs. This book provides a systematic approach to Rhinoplasty surgery in Indian patients with an emphasis on addressing the functional

measuring facial attractiveness and along with it a detailed mathematical analysis and understanding of facial sexual dimorphism. Both the areas of ophthalmic and facial plastic and reconstructive surgery and the areas of facial attractiveness and recognition research in psychology would greatly benefit from achieving these goals. The objective of this work has been to: develop and test a system for measuring facial attractiveness in an objective manner; and analyze orbital and facial sexual dimorphism. A facial overlay system or mask variously called the phi, archetypal, golden, or golden ratio mask has been claimed to be capable of being adapted to create an objective system for measuring facial attractiveness. The central hypothesis of the thesis is that the phi mask can be used to create an objective measurement system for facial

Get Free Ethnic Considerations In Facial Plastic Surgery

attractiveness. Over a period of seven years, we have created a standardized high resolution photographic facial database of 18-30 year old male and female adults, as well as database of linked facial anthropometric and photogrammetric measurement data. We have also designed a system using the phi mask that attempts to measure facial attractiveness objectively, and tested it against our facial database. Finally, we have made a detailed analysis of the measurement data and previous literature with respect to precisely defining sexual dimorphism around the eyes and face. Results support our central hypothesis in that the phi mask in its current form does yield a measure for objective attractiveness that correlates to the current "gold standard" measure of attractiveness - 'truth of consensus'. However, while the mask is capable of explaining

Get Free Ethnic Considerations In Facial Plastic Surgery

a major portion of the variance in facial attractiveness, it is not the final complete answer. Strengths, weaknesses and limitations of the approach and the model used are discussed, and ideas and directions for further research to develop a more accurate system are suggested. The analysis of the orbits and the face for sexual dimorphism yielded a great deal of new data and have lead to an understanding of sexual differences that have practical implications for both surgery and further facial research. Applications of the research include: Preoperative aids for planning plastic and reconstructive surgery, cosmetic surgery, and sex-altering surgery; standards for analyzing the eyes for academic study; standards for quantifying the features of the eyes for use in an identification system; aid in application of cosmetics; aid in understanding the psychological
