As health problems such as obesity, heart disease and diabetes increase in many developed and developing countries, the food industry has come under mounting pressure to improve the nutritional quality of its products. Particular attention has focused on the health problems associated with saturated fats in food and on the potential health benefits of increasing monounsaturated and polyunsaturated fat content. Summarising key research in this field, this important collection reviews both the influence of dietary fats on health and practical strategies for improving the fat content of food products. Part one reviews the evidence on the links between dietary fats and health. There are chapters on the links between saturated fatty acid intake, obesity, coronary heart disease, diabetes and cancer, as well as the health benefits of monounsaturated fats, polyunsaturated fatty acids (PUFAs) and conjugated linoleic acids (CLAs). Part two then discusses ways of reducing saturated fatty acids in food. It includes chapters on the role of lipids on food quality and ways of gaining consumer acceptance of low-fat foods, as well as chapters on improving fatty acid composition in dairy products and milk and the use of fat replacers. The final part of the book reviews ways of using polyunsaturated and other modified fatty acids in food products. It includes chapters on developing and using PUFAs as functional ingredients and ways of improving the sensory quality of products incorporating modified fats. With its distinguished editors and international team of contributors, *Improving the fat content of foods* is a standard reference for nutritionists and product developers in the food industry. Reviews the influence of dietary fats on health Investigates practical strategies for improving the fat content of food products Discusses improving the fat content of foods whilst maintaining sensory quality

This wild flower identification guide was first published in 1981 and is still widely accepted as the best of its kind for its combination of meticulous illustrations and the use of keys to aid recognition. For this new edition the Latin names have been revised in accordance with the current classification system. It is now published as the ideal book for the serious student of British and north-west European wild plants, providing a bridge between picture identification guides and the non-illustrated academic floras.

This hand book provides detailed information on the nutrient composition of a wide range of common Indian foods available in different parts of India. It also includes a write-up on the basic aspects of human nutrition. The nutrient composition covers 600 foods, both familiar and less familiar. Only those foods with confirmed scientific names have been included. Besides English, names of the foods in several Indian languages are also given for easy identification by the user. The data on nutrient composition of foods given in this book are entirely based on Indian work, mostly carried out at the National Institute of Nutrition, Hyderabad, and other research Institutes and University laboratories. An attempt has been made to give a simple account of current concepts of nutritional principles, nutritional chemistry of major food groups and nutritional deficiency diseases, prevalent in the country. This book should be useful to the lay public as well as to the health professionals. Uptodate information on nutritional requirement and Recommended Dietary Allowances and Guidelines for formulation of nutritionally adequate diets are also given, for the benefit of professionals and informed public.

Divided into four sections covering anatomy in relation to crop management, anatomical descriptions of the major crop plants, anatomical changes in adaptation to environments and the link between anatomy and productivity, this book provides a comprehensive source of crop plant anatomy information. The crop areas covered include cereals, pulses and beans, oil crops and fibre crops. Suitable for students, researchers and professionals in the field, this book brings together economic plant anatomy and crop productivity for the first time. It is suitable for students and researchers of crop scienc.

Quality is a composite term encompassing many characteristics of foods. These include color, aroma, texture, general nutrition, shelf-life, stability, and possible presence of undesirable constituents. Obviously deterioration of quality may lead to changes in the attributes that characterize the food in its fresh or freshly processed state. In addition, quality enhancement of products may be carried out using appropriate processing techniques. Interaction of different components present with one another could have a profound effect on sensory quality of products. Meanwhile, presence of extraneous matter such as pesticides and debris may also contribute to a compromise in the quality of foods. In addition, processing often brings about changes in many attributes of food including its nutritional value. Thus, examination of process-induced changes in food products is important. In this book, a cursory account of quality attributes of fresh and processed foods is provided. The book is of interest to food scientists, nutritionists and biochemists in academia, government and industry.

With exponentially increasing population across the globe and shrinking resources, the concern of food security is looming large over the world community. To catch up with the fierce pace of growth in all the sectors of development, ensuring uninhibited availability of food resources is a prime agenda. The growing global demand for food, feed, fiber and bio-based renewable materials, such as bio-fuels, is changing the conditions for genetic resources development and bio-resource production worldwide. The crucial role in ensuring food security is played by the agro-based industries and enterprises. Advances in plant genetic resources coupled with traditional knowledge of the local tribes and native practices facilitate achievement of food security.

The genus Rhodiola (Family Crassulaceae) is indigenous to Northern Canada, Europe and Asia where its rhizomes and roots have been used for centuries for medicinal purposes. Recent interest in the species Rhodiola rosea (roseroot) in the West arose from the use of the rhizome as an adaptogen for the treatment of stress, but in the last few years, chemical and pharmacological studies have confirmed other valuable medicinal properties. Written by well-known researchers in this field of study, Rhodiola rosea examines important aspects of this increasingly important medicinal plant, including: Cultivation Taxonomy Ethnobotany Conservation Phytopathology Phytochemistry Pharmacology Biotechnology The book discusses in vitro culture of R. rosea and examines pests and diseases affecting the plant in Europe, Canada, and Alaska. It also examines pharmacological bioassays and toxicology. The contributors provide a meta-analysis of clinical trials and describe experimentation with R. rosea in clinical practice. They explore its use in a range of areas, including for depression and anxiety disorders, to improve sexual and immune functions, to augment cancer treatment, and in aerospace medicine for afflictions such as mountain sickness and jet lag. The final chapter uses a model to illustrate the cultivation of R. rosea as an industrial crop from field to medicine to cabinet. Synthesizing the most important literature in recent years, the book supplies a comprehensive peer-reviewed survey of the wide spectrum of possibilities for its use as a modern phytomedicinal agent.

Drawn from the 7th Glion Colloquium held in 2009, this volume considers the role of research universities in an innovation-driven global society. Whether in the "old world" of Europe and North America or in rapidly developing nations, the message is clear: innovation has become the key to prosperity and social well-being in a hypercompetitive global economy. Part I introduces several forms of economic, technological, and social innovation. Part II discusses agents of innovation from the points of view of a research university, industry, and national innovation policies. Part III presents university leaders from long-established and emerging institutions to compare how regional and institutional characteristics shape innovation strategies. Part IV focuses on approaches to innovation at national and institutional levels, including a U.S. approach to energy challenges, the shift of high-tech industry toward open innovation, and the challenges of creating world-class universities. Part V addresses the intellectual character of innovation and its relationship to the university's mission. Today's economy requires not only leadership in innovation but also educated citizens capable of applying technology, talent, and capital in new ways. Institutions of higher learning must collaborate with industry and government to create a climate and culture that enable innovation to thrive.

The collection of papers in this book and its companion volume, *Property Rights in Social and Ecological Context: Case Studies and Design Applications*, (*) examine the relationships between people, the environment, and property rights and the ways in which a given social and ecological context affects those relationships. The papers are products of a research program at the Royal Swedish Academy of Sciences, Stockholm. The main objective of the program was to convene social scientists and natural scientists to address research questions in their full social and ecological dimensions. The program's participants addressed five general issues related to property rights and the environment: (1) the design of governance systems for sustainability; (2) the relationship between equity, stewardship, and environmental resilience; (3) the use of traditional knowledge in resource management, (4) the mechanisms that link people to their environments, and (5) the role played by population and poverty. The companion volume presents case studies that address questions of design application in those five areas. (*) Also available: *Property Rights in a Social and Ecological Context: Case Studies and Design Applications*. (ISBN 0-8213-3416-6) Stock No. 13416.

Ants are probably the most dominant insect group on Earth, representing ten to fifteen percent of animal biomass in terrestrial ecosystems. Flowering plants, meanwhile, owe their evolutionary success to an array of interspecific interactions—such as pollination, seed dispersal, and herbivory—that have helped to shape their great diversity. *The Ecology and Evolution of Ant-Plant Interactions* brings together findings from the scientific literature on the coevolution of ants and plants to provide a better understanding of the unparalleled success of these two remarkable groups, of interspecific interactions in general, and ultimately of terrestrial biological communities. *The Ecology and Evolution of Ant-Plant Interactions* synthesizes the dynamics of ant-plant interactions, including the sources of variation in their outcomes. Victor Rico-Gray and Paulo S. Oliveira capture both the

emerging appreciation of the importance of these interactions within ecosystems and the developing approaches that place studies of these interactions into a broader ecological and evolutionary context. The collaboration of two internationally renowned scientists, *The Ecology and Evolution of Ant-Plant Interactions* will become a standard reference for understanding the complex interactions between these two taxa.

Agronomy deals with the science and technology of producing and using plants for food, fuel, fiber, and land reclamation. The importance of agronomy provides farmers with agricultural information about how to grow and care for plants and soils in certain environments.

Factors such as climate, roots, moisture, weeds, pests, fungi, and erosion can pose significant challenges when farmers attempt to produce a plentiful harvest. In order to discover ways of integrating crops into the environment in ways that will allow them to prosper,

agronomists study these agricultural hurdles. Throughout history, scientific and technological advances have greatly impacted the agriculture industry. Early farmers improved their crop production by inventing the first hoes. Today, farmers improve crop production through the use of global positioning systems (GPS). How did these changes happen? How did people learn about new ideas? How have these ideas changed farming methods? In recent times, research and development in this area have made innovations in farming products and practices.

Fundamentals Of Agronomy presents the comprehensive coverage in the pursuit of improving the yield of crops, protecting crops against diseases and pest, making livestock healthy all the time, designing the best method of crops storage and even helping in predicting the climate conducive for agricultural practice cannot be over emphasized. Crop protection is very vital in agriculture. Disease affects plants and leads to delay in metabolic activities, stunted growth, shedding of flowers and fruits and sometimes the actual death of the plant. Cultural and chemical controls are most of the time used. Culturally, crop rotation is adopted, burning remains after harvesting, regular weeding of the soil, proper spacing of crops using of high yielding and resistant varieties and practicing of irrigation during dry season are adopted. This book will be of interest to students, professional practitioners, educators, and advisers who work directly with farmers, companies, and others in the agriculture community to implement the latest methods and tools for growing crops profitably and sustainably.

The global obesity epidemic is arguably the most serious health issue facing the food industry today. Food manufacturers are under increasing pressure over both the degree to which they are seen as contributing to the problem, and the role they should play in solving it. Drawing on the expertise of many of the world's leading experts in this area, Food, diet and obesity summarises the key research on the links between obesity and diet. Topics discussed include trends in obesity, the evidence behind popular diets and meal replacers, the effectiveness of fat and sugar replacers in food, emerging issues such as the value of the glycemic index, protein content and calcium in weight control, and potential functional food targets and ingredients for weight control. After an introductory chapter on global trends in obesity, part one looks at the range of contributing factors to obesity, from nutrient-gene interactions, energy metabolism and physical activity to sensory responses to food, portion size and the psychology of overeating. Part two looks at macronutrients and their role in weight gain or loss, with chapters on topics such as energy density, dietary fat, carbohydrates, protein and dietary fibre. The final part of the book discusses issues in developing effective strategies for weight control, from gaining consumer acceptance of weight-control food products, through functional food ingredients, to community-based public health approaches in preventing obesity. With its distinguished editor and contributors, Food, diet and obesity is a standard work for health professionals, nutritionists and R&D staff throughout the food industry, as well as all those concerned with understanding and reducing obesity.
