Waiting in lines is a staple of everyday human life. Without really noticing, we are doing it when we go to buy a ticket at a movie theater, stop at a bank to make an account withdrawal, or proceed to checkout a purchase from one of our favorite department stores. Oftentimes, waiting lines are due to overcrowded, overfilling, or congestion; any time there is more customer demand for a service than can be provided, a waiting line forms. Queuing systems is a term used to describe the methods and techniques most ideal for measuring the probability and statistics of a wide variety of waiting line models. This book provides an introduction to basic queuing systems, such as M/M/1 and its variants, as well as newer concepts like systems with priorities, networks of queues, and general service policies. Numerical examples are presented to guide readers into thinking about practical real-world applications, and students and researchers will be able to apply the methods learned to designing queuing systems that extend beyond the classroom. Very little has been published in the area of queuing systems, and this volume will appeal to graduate-level students, researchers, and practitioners in the areas of management science, applied mathematics, engineering, computer science, and statistics.

Secrets to Explosive Growth, Innovation, Leadership and Gaining an Unfair Advantage

Nearly one-eighth of the lumber produced in the United States goes into wood pallets, stimulating the Forest Products Laboratory to search for better techniques of pallet construction and handling. Extensive research at the Laboratory centered on impacts between pallets and forklift tines during loading. This report covers two successive studies that showed: The strong desirability of using an 'impact panel' attachment to the forklift trucks that handle wood pallets; and a strong advantage in butting the first and second top end deckboards if the pallets are to be handled by a conventional forklift truck. Use of an impact panel can greatly decrease the damage to reuseable pallets.

Service tests were made: (1) To determine the suitability of the test item in performance of its mission as material handling equipment for use under adverse conditions; (2) To obtain operational and maintenance data for evaluating the performance of the vehicle; (3) To determine possible design deficiencies and recommend corrective action, if necessary; (4) To determine whether the item is suitable for adoption through type classification action. Furnish justification if adoption is not recommended; and (5) To afford field units an opportunity to offer suggestions for improvement on future models based on operating experience with the vehicle while performing tasks within the scope of the vehicle's military mission. The results indicate conclusively that the 15,000 lb Rough Terrain Forklift can adequately perform the mission it was designed for. The test further indicated that this item would be a very valuable asset to the Transportation Corps in the accomplishment of its mission in an active theater of operations. That the tested item is entirely compatible with established military characteristics within the range of the tests performed and is suitable for use by the Armed Forces. (Author).
