**ABOUT THE BOOK** Three of saddest words in English are "If I'd only..." As in, "If I'd only invested in blue-chip stocks..." or "If I'd only saved some money..." But those words become more tragic when applied to your PC. "If I'd only backed up my PC, I wouldn't have lost all my files," or "If I'd only updated my anti-virus software, I wouldn't have to buy a new computer" are thoughts that must confronted all too often. Just thinking about those disasters can make one cry. Having a damaged PC is a tragedy, because many problems are preventable. You just need the right strategies and tools. Arming your PC doesn't require lots of money or time. Just follow these basic steps **MEET THE AUTHOR** Afri is a content creator who has more than 20 years experience as a journalist and author. A computer virus uses your PC in a similar way. The virus embeds itself in a legitimate program, but it can't execute or open by itself. Opening the infected program executes the virus, and trouble starts. The effect can more devastating if the malware is a worm. A worm is a type of virus that spreads throughout networks. It's more dangerous because it can replicate itself. In 2000, the "I Love You" worm infected more than 50 million computers. Its victims included the British Parliament, the CIA, and the Pentagon. Anti-virus software can keep viral programs from turning your PC into an incubator. If the software detects a virus, it can remove or quarantine it. However, viruses are created constantly, so anti-viral software requires regular updates to be effective. You can configure the program to update automatically and you can also schedule regular scans of your entire system. You don't have to spend a lot of money to get decent software. Here are the top 3 free anti-virus programs, courtesy of PC World magazine: Buy a copy to keep reading!

Anti-virus software is a program or set of programs that are designed to prevent, search for, detect, and remove software viruses, and other malicious software like worms, trojans, adware. These tools are critical for users to have installed and up-to-date because a computer without anti-virus software installed will be infected within minutes of connecting to the internet. The bombardment is constant, with anti-virus companies update their detection tools constantly to deal with the more than 60,000 new pieces of malware created daily. There are several different companies that build and offer anti-virus software and what each offers can vary but all perform some basic functions: \* Scan specific files or directories for any malware or known malicious patterns\* Allow you to schedule scans to automatically run for you\* Allow you to initiate a scan of a specific file or of your computer, or of a CD or flash drive at any time.\* Remove any malicious code detected -sometimes you will be notified of an infection and asked if you want to clean the file, other programs will automatically do this behind the scenes.\* Show you the 'health' of your computerAlways be sure you have the best, up-to-date security software installed to protect your computers, laptops, tablets and smartphones.
