

G S Birdie Environmental Engineering

The book in its present form introduces detailed descriptions and illustrative solved problems in the fields of Water Supply, Sanitary and Environmental Engineering. The entire subject matter has been split up in three parts: Part I Water Supply Engineering Part II Sanitary Engineering Part III Environmental Engineering. The first part deals with Water Supply Engineering which is related to demand of water for various purposes in human life, sources of water supply, quantity and quality of water, treatment and distribution of water, etc. The second part deals with Sanitary Engineering which is related to quality and quantity of sewage, construction and design of sewers, methods of treatment of sewage, etc. The third part discusses various aspects of Environmental Engineering including air pollution, noise pollution, etc. A typical design of a domestic sewage treatment plant is given in the Appendix as an additional attraction. The book now contains: * 253 * 140 * 60 * 610 Self-explanatory and neat diagrams Illustrative problems Useful tables Questions at the end of chapters. It is hoped that the book in its present form will be extremely useful to the Engineering students preparing for the Degree Examinations in Civil Engineering of all the Indian Universities, Diploma Examinations conducted by various Boards of Technical Education, Certificate Courses as well as for A.M.I.E., U.P.S.C., other similar Competitive and Professional Examinations.

Principles of Water Treatment has been developed from the best selling reference work Water Treatment, 3rd edition by the same author team. It maintains the same quality writing, illustrations, and worked examples as the larger book, but in a smaller format which focuses on the treatment processes and not on the design of the facilities.

Design of water distribution networks is traditionally based on trial-and-approach in which the designer assumes, based on experience and judgment, sizes of different elements and successively modifies them until a network with satisfactory hydraulic performance is obtained. This text covers: - Essential hydraulic, economic optimization principles. - Theory is developed gradually for optimal design of simple, single-source branched networks subjected to single loading to complex, multiple-source looped networks subjected to multiple loading. - Strengthening and expansion of existing networks and also reliability-based design. - Several illustrative examples enabling the reader to apply them in practice- approximately 100 line drawings.

Water Supply and Sanitary Engineering-includings Environmental Engineering

Perspectives in Environmental Studies

The supply of healthy drinking water and disposal of our wastewater is a central problem. Solving this problem is one of the claims of the UN Millennium Development Goals, and consequently an obligation for all those involved with water to join efforts in finding solutions. Climate change, population growth, migration and urban sprawl are factors forcing us to reconsider the traditional approach to urban water management. The water supply and sanitation infrastructure currently in use worldwide was developed in and for countries which are relatively wealthy, and which have access to plenty of water. Is it really wise to build the same kind of infrastructure and to apply the same methods and processes in regions with different climatic, ecological and economical conditions? Should we maintain our flush and discharge sanitation concepts while freshwater is becoming a limited resource? Aren't there smarter more environmentally sound methods to use and safeguard our precious water resources? Are water authorities, city planners, architects, regulators and politicians ready to accept innovative solutions deviating from those described in textbooks? Questions like these were raised during the International Symposium Water Supply and Sanitation for All held in Berching, Germany from September 27 - 28, 2007. This book collects the papers presented at this conference. This textbook focuses specifically on the combined topics of irrigation and drainage engineering. It emphasizes both basic concepts and practical applications of the latest technologies available. The design of irrigation, pumping, and drainage systems using Excel and Visual Basic for Applications programs are explained for both graduate and undergraduate students and practicing engineers. The book emphasizes environmental protection, economics, and engineering design processes. It includes detailed chapters on irrigation economics, soils, reference evapotranspiration, crop evapotranspiration, pipe flow, pumps, open-channel flow, groundwater, center pivots, turf and landscape, drip, orchards, wheel lines, hand lines, surfaces, greenhouse hydroponics, soil water movement, drainage systems design, drainage and wetlands contaminant fate and transport. It contains summaries, homework problems, and color photos. The book draws from the fields of fluid mechanics, soil physics, hydrology, soil chemistry, economics, and plant sciences to present a broad interdisciplinary view of the fundamental concepts in irrigation and drainage systems design.

PART- 1 : Water Supply EngineeringIntroduction * Quantity of Water * Sources of Water * Pumps Intakes and Conveyance of Water * Quality of Water * Lying and Water maintenance of Pipe lines * Pipe Appurtenances * Distribution of Water * Storage and Distribution Reservoirs and Waste * Water Survey * Water Treatment Processes * Plain Sedimentation -Coagulation * Filtration * Disinfection * Miscellaneous Processes of Treatment * Water Supplies and Radio Activity * Special Problems of Rural Water Supply * Water Pollution Control * Financing and Management of Water Supply Schemes.PART- II : Sanitary EngineeringIntroduction and Definition * Collection and Conveyance of Sewage * Quality of Sanitary Sewage and Storm Water H Construction of Sewage H Design of Sewers H Sewer

Appurtenances H Maintenance of Sewers H Sewage Pumping * Planning of Sewage System * Characteristics and Composition of Sewage * Sewage Disposal * Sewage Treatment * Preliminary Treatment of Sewage * Sedimentation * Chemical Precipitation * Trickling Filters * Activated Sludge Processes * Sewage Sludge Treatment and Disposal * Chlorination * Stabilization Ponds * Industrial Wastes Tank and Imhoff Tank * Sanitary Fittings * House Drainage * Rural Miscellaneous Topics.

Water Engineering

Environmental Pollution Control Engineering

Irrigation and Water Resources Engineering

The industry standard reference for water treatment plant design and modernization has been updated to include hot topics such as security and design, vulnerability assessments, and planning against vandalism and sabotage, as well as the latest information on codes, regulations, and water quality standards. * Latest code updates and new water quality standards * Design operation and analysis of treatment facilities

Appropriate for undergraduate engineering and science courses in Environmental Engineering. Balanced coverage of all the major categories of environmental pollution, with coverage of current topics such as climate change and ozone depletion, risk assessment, indoor air quality, source-reduction and recycling, and groundwater contamination.

This book provides a comprehensive introduction to air, water, noise, and radioactive materials pollution and its control. Legal and regulatory principles and risk analysis are included in addition to engineering principles. The text presents the engineering principles governing the generation and control of air and water pollutants, solid and hazardous waste, and noise. Water quality and drinking water treatment are discussed, as well as the elements of risk analysis. Radioactive waste generation and treatment in relation to the nuclear fuel cycle, are discussed. The health and environmental effects of all these pollutants are discussed. An introduction to the Federal laws and regulations governing pollution is included. - This text embraces the latest thinking in environmental engineering - Includes updates in regulation and current pollution abatement technologies

Environmental Studies Pertain To A Systematic Analysis Of The Natural And Man-Made World Encompassing Various Scientific, Economic Social And Ethical Aspects. Human Impacts Leading To Large-Scale Degradation Of The Environment Have Aroused Global Concern On Environmental Issues In The Recent Years. The Apex Court Has Hence, Issued Directive To Impart Environmental Literacy To All.In This Book The Fundamental Concepts Of Environmental Studies Have Been Introduced And Analyzed In A Simple Manner Strictly As Per The Module Syllabus Designed By The Ugc For Undergraduate Courses In Science, Humanities, Engineering, Medicine, Pharmacy, Commerce, Management And Law. Besides The Undergraduate Students Of All Disciplines The Book Will Also Be Useful For Those Appearing In Various Competitive Exams Since Environmental Issues Now Find A Focus In Most Of Such Examinations. The Contents Of The Book Will Be Of Interest To All Educationists, Planners And Policy Makers.Key Features Of The Book Include A Simple And Holistic Approach With Illustrations, Tables And Specific Case Studies Mainly In The Indian Context. The Basic Terminologies Have Been Defined In The Text While Introducing The Topics Some Useful Terms Mentioned In The Text Have Been Explained In The Glossary For An Easy Grasp By Students Of All Disciplines.

Complex environmental problems are often reduced to an inappropriate level of simplicity. While this book does not seek to present a comprehensive scientific and technical coverage of all aspects of the subject matter, it makes the issues, ideas, and language of environmental engineering accessible and understandable to the nontechnical reader. Improvements introduced in the fourth edition include a complete set of the chapters dealing with risk assessment and ethics, the introduction of new theories of radiation damage, inclusion of environmental disasters like Chernobyl and Bhopal, and general updating of all the content, specifically that on radioactive waste. Since this book was first published in 1972, several generations of students have become environmentally aware and conscious of their responsibilities to the planet earth. Many environmental pioneers are now teaching in colleges and universities, and have in their classes students with the same sense of dedication and resolve that they themselves brought to the discipline. In those days, it was sometimes difficult to explain what indeed environmental engineering was, and why the development of these fields was so important to the future of the earth and to human civilization. Today

question that the human species has the capability of destroying its collective home, and that we have indeed taken major steps toward exactly that. And yet, while, a lot has changed in a generation, much has not. We still have air pollution; we still contaminate our water; we still dispose of hazardous materials improperly; we still destroy natural habitats as if no other species mattered. And worst of all, we continue to populate the earth at an alarming rate. There is still a need for this book, and for the college and university courses that use it, and perhaps this need is more acute now than it was several decades ago. Although the battle to preserve the environment is still raging, the rules have changed. We now must take into account risk to humans, and be able to manipulate concepts of risk management. With a growing population, and fewer alternatives to waste disposal, this problem is intensified. Environmental laws have changed, and will no doubt continue to evolve. Attitudes toward the environment are often couched in what has become known as the environmental ethic. Finally, the environmental movement has become powerful politically, and environmentalism can be made to serve a political agenda. In revising this book, we have attempted to incorporate the evolving nature of environmental sciences and engineering by adding chapters as necessary and eliminating those that are less germane to today's students. We have nevertheless maintained the essential feature of this book -- to package the more important aspects of environmental engineering science and technology in an organized manner and present this mainly technical material to a nonengineering audience. This book has been used as a text in courses which require no prerequisites, although a high school knowledge of chemistry is important. A knowledge of college level algebra is also useful, but calculus is not required for the understanding of the technical and scientific concepts. We do not intend for this book to be scientifically and technically complete. In fact, many complex environmental problems have been simplified to the threshold of pain for many engineers and scientists. Our objective, however, is not to impress nontechnical students with the rigors and complexities of pollution control technology but rather to make some of the language and ideas of environmental engineering and science more understandable.

Berdasarkan KepPres No. 26 Tahun 2011 Tentang Penetapan Cekungan Air tanah, ruang darat Indonesia di bawah muka tanah dibagi menjadi daerah cekungan air tanah (CAT) dan Bukan (Non) CAT atau CAT tidak potensial. Perinciannya adalah ruang darat seluas 1,922,600 km² (47,2 %) terdiri atas CAT seluas 907,615 km² (atau 47,2 % luas daratan) dan Non-CAT seluas 1,014,985 km² (atau 52,8 % luas daratan). Menurut definisi tata ruang dalam UU No. 26 Tahun 2007 Tentang Penataan Ruang, tata ruang air tanah dapat didefinisikan sebagai wujud ruang air tanah dan pola ruang air tanah. Struktur ruang air tanah adalah susunan pusat-pusat sumber daya air tanah dan sistem infrastruktur air tanah berupa akuifer tertekan (confined aquifer) dan akuifer bebas (unconfined aquifer) dalam cekungan air tanah (groundwater basin). Air tanah dalam hal ini terjemahan dari groundwater namun juga air tanah yang diterjemahkan dari soil water. Di atas groundwater ada daerah vadose zone yang berisi soil water. Air dalam perspektif siklus hidrologi secara global mengikuti, lewat, berada dan mengalir melalui ruang udara, ruang darat (baik daerah CAT maupun daerah Non-CAT) dan ruang laut. Air terdiri atas air permukaan, air tanah, air hujan dan air yang berada di darat. Dari sisi air tanah maka ada beberapa substansi penting dalam ruang darat, yaitu:

- Karakter CAT dan Non-CAT berbeda baik di muka bumi maupun di bawah muka bumi.
- Di daerah CAT air tanah terdiri atas groundwater dan soil water. Di daerah Non-CAT hanya ada soil water.
- Di muka bumi CAT dan Non-CAT mempengaruhi fluvial system (DAS dan sistem jaringan sungainya).
- Ada beberapa daerah CAT di Indonesia yang bersifat aluvial, produk dari sedimen muda dan terletak di cekungan sedimen muda (young sedimentary basin) terbentuk pada jaman kuartar/holosen. Di daerah ini fluvial system bersifat saluran/sungai beregim (channel in regime) sedangkan fluvial system di daerah Non-CAT termasuk daerah saluran/sungai non regim (non-regime channel).
- o Sungai beregim (daerah CAT) akan selalu berubah untuk mencapai keseimbangan antara aggradasi (penambahan sedimen) dan degradasi (gerusan). Muatan sedimen utamanya pasir, lanau dan lempung. Umumnya ada di sungai ini.
- o Sungai non regim (daerah Non-CAT) dikontrol oleh: lapisan batuan dasar dan aluvial tua.
- o Dengan kata lain, keberadaan air tanah dalam CAT dan Non-CAT berpengaruh terhadap air permukaan sekaligus dengan sumber daya air.
- Ada juga daerah CAT yang bukan aluvial misalnya CAT pada batuan kapur, di mana air mengalir melalui celahan atau rekahan batuan tersebut.
- Di daerah CAT potensi longsor tinggi. Contoh yang pernah terjadi yaitu bencana banjir bandang Leuser di Sumatra, bencana Wasior di Papua, longsoran di Banjarnegara Jawa Tengah, gerakan tanah pada pembangunan Jalan Tol Semarang Solo di Ungaran dan Penggaron dan amblesnya beberapa bangunan di Proyek Hambalang.
- Di daerah CAT dengan kedalaman dangkal banyak terjadi perubahan sungai dan juga berpotensi longsor. Contoh perubahan sungai adalah S. Palu di Kota Palu dan contoh longsor yang pernah terjadi adalah bencana longsor di Desa Pulau Aro Kecamatan Sekernan Kabupaten Muaro Jambi yang dilalui S. Batanghari yang terjadi di Bulan Agustus lalu.

Indonesia merupakan negara kepulauan (archipelago islands) yang terluas di dunia dengan jumlah pulau 17508. Lima pulau besar dengan luas > 100000 km² adalah Kalimantan, Sumatra, Papua, Sulawesi, Jawa; ada 26 pulau mempunyai luas > 1000 km²; sisanya 17477 (99,8% dari seluruh pulau) adalah pulau-pulau kecil dengan luas

Like most technical disciplines, environmental science and engineering is becoming increasingly specialized. As industry professionals focus on specific environmental subjects they become less familiar with environmental problems and solutions outside their area of expertise. This situation is compounded by the fact that many environmental science related terms are confusing. Prefixes such as bio-, enviro-, hydra-, and hydro- are used so frequently that it is often hard to tell the words apart. The Environmental Engineering Dictionary and Directory gives you a complete list of brand terms, brand names, and trademarks - right at your fingertips.

The book is written in simple language and self explanatory, reflects the image of the author's long experience in field and teaching as well. The new edition of the book is a composite unit, complete in itself. The presentation of the matter is simple and excellent.

This book presents the proceedings of the International Conference on Health, Safety, Fire, Environment, and Allied Sciences (HSFEA 2018), highlighting the latest developments in the field of science and technology aimed at improving health and safety in the workplace. The volume comprises content from leading scientists, engineers, and policy makers, discussing water pollution and advanced remedial measures, and the impact on health and the environment. Topics of discussion include research on emerging water pollutants, their sources, monitoring and control. The contents of this volume will be of interest to researchers, practitioners, and policy makers alike.

Water Supply And Sanitary Engineering

The Book Irrigation And Water Resources Engineering Deals With The Fundamental And General Aspects Of Irrigation And Water Resources Engineering And Includes Recent Developments In Hydraulic Engineering Related To Irrigation And Water Resources Engineering. Significant Inclusions In The Book Are A Chapter On Management (Including Operation, Maintenance, And Evaluation) Of Canal Irrigation In India, Detailed Environmental Aspects For Water Resource Projects, A Note On Interlinking Of Rivers In India, And Design Problems Of Hydraulic Structures Such As Guide Bunds, Settling Basins Etc. The First Chapter Of The Book Introduces Irrigation And Deals With The Need, Development And Environmental Aspects Of Irrigation In India. The Second Chapter On Hydrology Deals With Different Aspects Of Surface Water Resource. Soil-Water Relationships Have Been Dealt With In Chapter 3. Aspects Related To Ground Water Resource Have Been Discussed In Chapter 4. Canal Irrigation And Its Management Aspects Form The Subject Matter Of Chapters 5 And 6. Behaviour Of Alluvial Channels And Design Of Stable Channels Have Been Included In Chapters 7 And 8, Respectively. Concepts Of Surface And Subsurface Flows, As Applicable To Hydraulic Structures, Have Been Introduced In Chapter 9. Different Types Of Canal Structures Have Been Discussed In Chapters 10, 11, And 13. Chapter 12 Has Been Devoted To Rivers And River Training Methods. After Introducing Planning Aspects Of Water Resource Projects In Chapter 14, Embankment Dams, Gravity Dams And Spillways Have Been Dealt With, Respectively, In Chapters 15, 16 And 17. The Students Would Find Solved Examples (Including Design Problems) In The Text, And Unsolved Exercises And The List Of References Given At The End Of Each Chapter Useful.

This Revised Edition Of The Book On Environmental Pollution Control Engineering Features A Systematic And Thorough Treatment Of The Principles Of The Origin Of Air, Water And Land Pollutants, Their Effect On The Environment And The Methods Available To Control Them. The Demographic And Environmental Trends, Energy Consumption Patterns And Their Impact On The Environment Are Clearly Discussed. Application Of The Physical, And Chemical Engineering Concepts To The Design Of Pollution Control Equipment Is Emphasized. Due Importance Is Given To Modelling, Quality Monitoring And Control Of Specific Major Pollutants. A Separate Chapter On The Management Of Hazardous Wastes Is Added. Information Pertaining To Indian Conditions Is Given Wherever Possible To Help The Reader Gain An Insight Into India Sown Pollution Problems. This Book Is Mainly Intended As A Textbook For An Integrated One-Semester Course For Senior Level Undergraduate Or First Year Post-Graduate Engineering Students And Can Also Serve As A Reference Book To Practising Engineers And Decision Makers Concerned With Environmental Pollution Control.

Revised papers submitted at a national symposium "Geo- Environmental Planning for Sustainable Rural Development" organized by the Post-Graduate Dept. of Geography, Manmohan Malviya Post-Graduate College, Kalakankar, Uttar Pradesh; with reference to India.
