In addition to familiarizing readers with common pediatric surgical conditions and helping them plan simple approaches to their management, it also offers an essential on-the-go guide. There is a tradition behind the current radiologic examination of the small bowel. Many of the great names in gastrointestinal radiology

have established their reputations on the basis of their work in the small bowel. This is an area which is assuming ever greater importance for radiologists as its mucosal surface continues to elude the endos copist. Moreover, it is an aspect of radiology which calls for the greatest technical and interpretative skill. It is a great pleasure to welcome the English language version of this beautiful work on Radiology of the Small Intestine. Diseases, 27th Edition, the new Red Book Atlas is a useful quick reference tool for the clinical diagnosis and treatment of more than 75 of the most commonly seen pediatric infectious diseases. Includes more than 500 full-color images adjacent to concise diagnostic and treatment guidelines. Essential information on each condition is presented in the precise sequence needed in the clinical setting: Clinical manifestations, Etiology, Epidemiology, Incubation period, Diagnostic tests, Treatment

The purpose of this series of

volumes is to present a comprehensive view of the complications that result from the use of acceptable diagnostic and therapeutic procedures. Individual volumes will deal with iatrogenic complications involving (1) the alimentary system, (2) the urinary system, (3) the respiratory and cardiac systems, (4) the skeletal system and (5) the pediatric patient. The term iatrogenic, derived from two Greek words, means physician-induced. Originally, it applied only to psychiatric disorders generated in the patient by autosuggestion, based on

misinterpretation of the doctor's attitude and comments. As clinically used, it now pertains to the inadvertent side-effects and complications created in the course of diagnosis and treatment. The classic categories of disease have included: (1) congenital and developmental, (2) traumatic, (3) infectious and inflammatory, (4) metabolic, (5) neoplastic, and (6) degenerative. To these must be added, however, iatrogenic disorders-a major, although generally unacknowledged, source of illness. While great advances in medical care in

both diagnosis and therapy have been accomplished in the past few decades, many are at times associated with certain side-effects and risks which may result in distress equal to or greater than the basic condition. Iatrogenic complications, which may be referred to as "diseases of medical progress," have become a new dimension in the causation of human disease. This is the third edition of a comprehensive study of the neuronal disorders of the lower gastrointestinal tract in children. Important new studies and progress in research on bowel motility and

motility disorders are covered in detail as well as new aspects concerning the embryology, functional anatomy of the enteric nervous system. In particular new insights have been received from the studies in the genetics of Hirschsprung's disease. Special emphasis is laid on new surgical techniques, especially on the laparoscopic approach in combination with Soave's or Duhamel's technique. Diagnostic reference levels (DRLs) are used in medical imaging to indicate whether the patient radiation dose or amount of administered

activity from a specific procedure are unusually high or low for that procedure. DRLs are the first step in the optimization process to manage patient dose commensurate with the medical purpose of the procedure. Achievable dose is an optimization goal, based on survey data, and typically defined as the median value (50th percentile) of the dose distribution of standard techniques and technologies in widespread use. The overarching goal is to obtain image quality consistent with the clinical objective, while avoiding unnecessary

radiation. Too low an exposure, however, is also to be avoided if it results in an inadequate image. This Report represents an important continuation of NCRP reports on radiation safety and health protection in medicine and lays the foundation for the development and application of DRLs and achievable doses for diagnostic x-ray examinations. The concept of DRLs is extended to procedures other than diagnostic x-ray examinations (e.g., for interventional radiology) by the use of reference levels (RLs), which represent radiation dose levels

that if exceeded prompt an evaluation of the reasons why. This Report discusses the establishment and use of RLs for fluoroscopically-guided interventional (FGI) procedures and describes why a different approach from DRLs is required to account for the greater complexity of interventional radiology compared with standard medical imaging procedures. Phantoms are models of the human body used in radiation dosimetry studies to estimate exposures to patients. The use of phantom survey data in the United States is contrasted with the use of patient-based

Every technique is clearly described under a set of standard headings (e.g. methods, indications, equipment, patient preparation, technique, aftercare, complications, further reading). The text adopts a synoptic style which makes for easy preparation for the FRCR and similar examinations The selectivity

of the techniques covered will focus a candidate's attention on what questions to expect. The use of standard headings makes the contents highly accessible for a reader. The new edition has been comprehensively updated throughout and will reflect the very latest equipment and practice developments. It will reference the key recent national and international guidelines (Royal College, Dept. Of Health, WHO) A new chapter on the 'Radiographer Role and Responsibilities in Interventional Radiology' will reflect the evolving role of the

advanced practitioner radiographer (working in collaboration with the radiologist). This will add utility/appeal to the radiographer market and aid understanding and be a more accurate reflection of the modern imaging service for radiologists There is a new chapter on ablative therapies. Mastering advanced medical coding skills is easier with Carol J. Buck's proven, step-by-step method! The Next Step: Advanced Medical Coding and Auditing, 2016 Edition uses real-world patient cases to explain coding for

important issues relating to GI contrast studies. Because Dr. Steven son's group performs endoscopic procedures, they are included in the manual. These authors are recognized scholars and leaders in gastrointestinal radiology. Thus, it is easy to understand why the manual is so well done. after completion of a study. All of us who teach gastrointestinal radiology are concerned about the decline in the number of gastrointestinal contrast studies. We are not sure how we can continue to teach our residents the proper techniques and maintain high-quality teaching programs in gastrointestinal radiology. A manual of this type is thus timely and appropriate. The manual will be a

**For all that new non-X-ray
technologies such as MR and
ultrasound and its various**

manifestations have made an enormous impact in recent years on the practice of medical imaging, the use of X-rays and X-ray contrast-enhancing agents has retained an important position at the heart of the process. Indeed, with its frequent requirements for high total dose regimes, CT has increased the use of contrast agents. Even helical/spiral CT which, it was initially argued, should reduce contrast as well as radiation loads, may actually require just as much or more of both because of the potential it offers for multi-phase scanning. Iodinated intravascular X-ray contrast agents, especially the more recently developed non-ionic agents, continue therefore to play a pivotal role in

clinical imaging. These succinct and authoritative articles, originally appearing in the journal *Advances in X-ray Contrast*, range sufficiently widely for their compilation in this volume to be considered a mini-textbook on the water-soluble iodinated X-ray contrast agents and their applications. Each is written by an acknowledged and experienced expert in the field. They usefully cover the developmental history of the agents; defined risk factors, approaches to prophylaxis and, ultimately, of the treatment of adverse reactions; the interesting subject of supposed delayed reactions to contrast agents; the important organ-specific toxicities, cardiac toxicity, neurotoxicity and

nephrotoxicity and high-dose toxicity as encountered in complex procedures; the sometimes special circumstances and occasional extreme conditions to which contrast agents may be exposed in Interventional Radiology; the special, in several ways, case of paediatric radiology; the controversial subject of thromboembolic phenomena in clinical angiography; and the precise role of contrast agents. As regards the practicalities of contrast administration regimes and imaging protocols it is really only in the area of CT that there is debate and controversy, and articles are included which cover CT of the liver, spleen and pancreas, and protocols

for the new spiral/helical technology and even for the much less widely available electron-beam CT technology visualization. Pulmonary embolus diagnosis and protocols for contrast administration with this technology are also discussed.

A classic text since it was first published in 1974, the Lippincott Manual for Nursing Practice (LMNP) has provided essential nursing knowledge and up-to-date information on patient care for nearly 40 years. Now in its 10th edition, this full-color text continues to serve as the most comprehensive reference for practicing nurses and nursing students worldwide. Often referred as the 'Lippincott Manual' or simply the 'Lippincott', the

LMNP is widely used as a procedure manual for many healthcare institutions (contains 157 Nursing Procedure Guidelines). It is also widely regarded as the Gold Standard for nursing practice in the classroom. Organized into five major parts, LMNP presents a comprehensive reference for all types of core nursing care. Part 1: Nursing Process & Practice; Part 2: Medical-Surgical Nursing; Part 3: Maternity & Neonatal Nursing; Part 4: Pediatric Nursing; Part 5: Psychiatric Nursing. Content is evidence-based with supporting articles highlighted in actual entries and procedure guidelines. Official Guidelines that shape practice are incorporated in to the content and

include those from the National Institutes of Health, American Diabetes Association, American Heart Association, American Nurses Association, Joint Commission, AWHONN, and others. A companion Website includes full text, an image bank, and drug-related NCLEX®-style questions, FDA updates, and new clinical studies.

cases reflect actual medical records and give you real-world experience with advanced coding. Enhance your decision-making skills and learn to confidently pull the right information from documents, select the right codes, determine the correct sequencing of those codes, properly audit cases, and prepare for the transition to ICD-10 with the help of coding author and educator Carol J. Buck! Realistic patient cases simulate the professional coding experience by using actual medical records (with personal patient details changed or removed), allowing you to practice coding with advanced material. Dual coding addresses the transition to ICD-10 by providing coding answers for both ICD-9 and

ICD-10. UNIQUE! Evaluation and Management (E/M) Audit Forms, developed to determine the correct E/M codes, simplify the coding process and help to ensure accuracy. Auditing cases prepare you to assign correct codes to complicated records, as well as audit records for accuracy.
