Language is of central importance in children's development and vital for their success at school and in the world beyond. Designed for the many professionals involved in encouraging language development, Early Language Development, originally published in 1990, will enable them to get to grips with the practical issues of helping children with language difficulties. John Harris provides an invaluable summary of recent research on language development and how it relates to the practical concerns of language assessment and language teaching. Readers are given a clear account of the ways in which research has expanded our understanding of just what language is and how this has led to different approaches to language assessment. Various theories of language development are summarised and discussed in terms of their implications for language teaching. Dr Harris also describes different ways of encouraging language development and explains how teachers and therapists can overcome the special problems faced by children with particular difficulties, such as visual impairment, hearing impairment, general learning difficulties, and environmental deprivation. With its emphasis on the relevance of research-based knowledge to practical concerns, the book provides a useful bridge between the world of research and practice. It will be of particular interest to teachers of young children, speech therapists, and child psychologists, as well as to students taking courses on child development, and to parents of young children.

JANET W. LERNER This timely volume explores issues pertinent to the emerging subject of college education for adults with learning disabilities. The inspiration for the book was a conference held at Barat College in Lake Forest Illinois on April 7, 1990, entitled College Students with Learning Disabilities: Reviewing the '80s and Planning for the '90s. The occasion was the celebration of the tenth anniversary of Barat College's program for college students with learning disabilities. Papers presented at this conference, plus several additional invited chapters, and those of the co editors are included in this much needed publication. Only a few years ago, college was out of the question for most adults with learning disabilities. It is heartening to note that this situation has changed substantially over the last 15 or so years, with great strides in opportunities for adults with learning disabilities to acquire a college level education. From a slow beginning with programs such as the one at Barat College, there are today programs and support services in a variety of settings at a growing number of colleges and universities. Many individuals with learning disabilities can look forward to experiencing college and better preparing themselves for the future. The collection of papers in this book offers a comprehensive review of this exciting and challenging field.

In the recent literature, the most influential case study books in neuropsychology are in the adult realm. Pediatric neuropsychology is a rapidly developing field with increasingly greater influence in the assessment, diagnosis, early identification, and treatment of childhood illnesses. This book will provide the first centralized, comprehensive resource for case studies in pediatric neuropsychology. Not only will this supply a valuable compilation for the growing numbers of professionals in this field, but will also serve as an innovative and appealing resource for therapists, teachers, and others interested in child development. This book will be structured in such a way that readers can easily access individual cases of interest, as well as related areas of dysfunction. Section breakdowns will be provided in order to highlight the combined focus of case presentations in acquired neuropsychological dysfunction as well as developmental disorders. Each section will begin with an introductory chapter, highlighting the salient feature of the concept and providing brief, up to date reviews of the current research and theories. Within each global section, individual case studies will serve as stand-alone chapters. Contributing authors will be provided extensive guidance and coaching with regards to the standard format and information to be included in each chapter. The first section of this book will present cases involving neurological disorders. The intention of this section is to provide not only "classic" examples of neurological dysfunction in children, but also to provide interesting cases of unique or remarkable presentations. The second section will present an accumulation of cases representing both common and progressive conceptualizations of developmental disabilities. Section three has been designed to highlight cases which often present complex issues to neuropsychologists. The case examples in this section will highlight the use of alternative treatments, pathologies that are often a source of inquiry, and situations that lack the more rigorous scientific data often utilized in other diagnostic procedures. Additionally, this section may include chapters on common differential diagnosis dilemmas in clinical practice. Often multifaceted and even contradictory evidence can arise during evaluations, resulting in complex or problematic situations for the clinician. Such examples are difficult, by their nature, to forecast, but rather would be added during the book's development, as they occur.

Ever since attempts were made to describe and explain normal language development, references to exceptional circumstances have been made. Variations in the conditions under which language is acquired can be regarded as natural experiments, which would not be feasible or ethical under normal circumstances. This can throw light on such questions as: *What language input is necessary for the child to learn language? *What is the relationship between cognition and language? *How independent are different components of language function? *Are there critical periods for language development? *Can we specify necessary and sufficient conditions for language impairment? This book covers a range of exceptional circumstances including: extreme deprivation, twinship, visual and auditory impairments, autism and focal brain damage? Written in a jargon-free style, and including a glossary of linguistic and medical terminology, the book assumes little specialist knowledge. This text is suitable for both students and practitioners in the fields of psycholinguistics, developmental and educational psychology, speech pathology, paediatrics and special education.

Collaborative Assessment is designed to help all professionals who work with visually impaired students understand the impact of visual impairment on assessing students' learning potential. Speech-Language Pathologists in Early Childhood Intervention: Working with Infants, Toddlers, Families, and Other Care Providers presents practicing clinicians and graduate students with the skills necessary to provide evidence-based best practice services to young clients struggling to gain functional communication skills and their families. It also serves to broaden the understanding of early intervention within the field of speech-language pathology. Through research, real life scenarios, and practical documents the text presents positive advocacy for this population. The text begins with a general overview of the history and rationale for early childhood intervention, including the Individuals with Disabilities Education Act (IDEA), Part C program, and Early Head Start, as well as a description of the need for speech-language pathologists in early intervention. The majority of the text offers assessment and intervention strategies and tools, including specific tests and curricula, training resources, and the importance of using ongoing assessment for this young age. Strategies for coaching parents and collaborating with professional colleagues as well as working within daily routines in natural environments for the child - all integral components of the Part C early intervention program - are interwoven throughout. The text concludes with the importance of viewing children holistically - taking into consideration all aspects of a child's being and acknowledging the interrelatedness of their developing skills as well as the importance of family in their development. Speech-language pathologists have a critical role in evaluation, assessment, and intervention for young children with or at risk for communication disorders. Speech-Language Pathologists in Early Childhood Intervention creates a pathway for investing in the principles and activities of early intervention that can lead to best practice and positive outcomes for this young population. *Disclaimer: Please note that ancillary content (such as documents, audio, and video, etc.) may not be included as published in the original print version of this book.

One of the most important practical problems in child psychology and psychia try is the differential diagnosis of emotional disorders. Until recently, the gener al mode of assessment had been to apply to children the characteristics of psychopathology that were evident in adults. In addition, there had been few assessment tools available for use with children aside from modified versions of adult instruments. Understandably, this approach was controversial, and dissat isfaction with it led to the more recent knowledge that adult and child problems may be manifested quite differently. The third edition of the Diagnostic and Statistical Manual of Mental Disorders takes these factors into account much more extensively than previous editions. Furthermore, a great deal of research on methodology in child assessment procedures has emerged recently. Yet, in spite of these advances, practicing clinicians are still frequently at a loss in moving from the characteristics of the disturbed child before them to the final assign ment of a psychiatric diagnosis. The focus of this book is to outline the various methods of viewing and categorizing the wide range childhood psycho pathology, with special emphasis on the end product of making a differential diagnosis. Our goal was to make this book unique in several ways. First, we attempted to cover a wider range of disorders than is typical in currently available hand books.

"Continuities and Discontinuities in Development" was the theme for the Second Biennial DPRG Retreat, a three-day meeting held at Estes Park, Colorado, in June 1982. The meeting was sponsored by the Devel opmental Psychobiology Research Group (DPRG) of the Department of Psychiatry at the University of Colorado School of Medicine. The DPRG is a group of individuals conducting research in many areas of develop ment who meet on a regular basis to present and discuss their work and receive feedback and encouragement. In 1974, this group was awarded an endowment fund by the Grant Foundation, the aims of which were to facilitate the research of young investigators, to encourage new re search, and to provide seed money for collaborative ventures. Much of the work reported in this volume and in the earlier volume from the First DPRG Retreat is the result of that support. In addition to the work of the members of the DPRG, a select group of guests was invited to participate in the meeting and contribute to this volume. The chapters by William Greenough, Jerome Kagan, and Michael Rutter result from the participation of these scholars at the retreat. We would like to acknowledge the support of a number of indi viduals who have been instrumental in supporting the DPRG as a whole, as well as those who contributed directly to the Second Biennial Retreat and to the volume.

Communication disorders are impairments in the ability to receive, send, process, and comprehend hearing, language, and/or speech. While the number of culturally diverse populations is growing in the United States, speech-language pathologists and audiologists lack information on serving these culturally diverse populations appropriately and effectively. Cases on Communication Disorders in Culturally Diverse Populations is an essential research publication that provides culturally-competent hearing, language, and speech services and cases across age groups, communication disorders, and culturally diverse populations. These case studies offer a practical and detailed means for assisting professionals in providing culturally-appropriate speech, language, and hearing services. Highlighting various topics such as counseling, language learning, and genetics, this book is indispensable for speech-language pathologists, audiologists, counselors, administrators, academicians, researchers, practitioners, and students.
