The definitive firsthand account of the groundbreaking research of Philip Zimbardo—the basis for the award-winning film *The Stanford Prison Experiment*—Renowned social psychologist and creator of the Stanford Prison Experiment Philip Zimbardo explores the mechanisms that make good people do bad things, how moral people can be seduced into acting immorally, and what this says about the line separating good from evil. *The Lucifer Effect* explains how—and the myriad reasons why—we are all susceptible to the lure of “the dark side.” Drawing on examples from history as

well as his own trailblazing research, Zimbardo details how situational forces and group dynamics can work in concert to make monsters out of decent men and women. Here, for the first time and in detail, Zimbardo tells the full story of the Stanford Prison Experiment, the landmark study in which a group of college-student volunteers was randomly divided into “guards” and “inmates” and then placed in a mock prison environment. Within a week the study was abandoned, as ordinary college students were transformed into either brutal, sadistic guards or emotionally broken prisoners. By illuminating the psychological causes behind such disturbing metamorphoses, Zimbardo enables us to better understand a variety of harrowing phenomena, from corporate malfeasance to organized genocide to how once upstanding American soldiers came to abuse and torture Iraqi detainees in Abu Ghraib. He replaces the long-held

notion of the “bad apple” with that of the “bad barrel”—the idea that the social setting and the system contaminate the individual, rather than the other way around. This is a book that dares to hold a mirror up to mankind, showing us that we might not be who we think we are. While forcing us to reexamine what we are capable of doing when caught up in the crucible of behavioral dynamics, though, Zimbardo also offers hope. We are capable of resisting evil, he argues, and can even teach ourselves to act heroically. Like Hannah Arendt’s *Eichmann in Jerusalem* and Steven Pinker’s *The Blank Slate*, *The Lucifer Effect* is a shocking, engrossing study that will change the way we view human behavior. Praise for *The Lucifer Effect* “The Lucifer Effect will change forever the way you think about why we behave the way we do—and, in particular, about the human potential for evil. This volume seeks to identify and define the parameters of a relatively new problem area -- parental development. Drawing on the grand developmental theories of Sigmund Freud, Lawrence Kohlberg, Jean Piaget, Lev Vygotsky, Heinz Werner, and their descendants, this book has the potential to generate an area of common concern for those interested in either child/adolescent or adult development through the novel application of developmental principles and considerations to the ecological context of parenting. To that end, this volume brings together theory and research from the subfields of adult and child/adolescent development. Chapter authors place the problem area of parental development in

theoretical context and examine selected psychological part-processes implicated by focusing on cognitive and psychosocial development. The authors then deal with a range of issues that are perhaps less traditional and/or more in line with the complex character of everyday life. That is, they utilize either relatively novel comparison groups or treat parents at later stages of development rather than those in young adulthood as is often the case. Finally, the authors uncover both similarities and differences among their theoretical perspectives with an eye toward delineating some possible future research directions.

Magicians have dazzled audiences for many centuries; however, few researchers have studied how, let alone why,

most tricks work. The psychology of magic is a nascent field of research that examines the underlying mechanisms that conjurers use to achieve enchanting phenomena, including sensory illusions, misdirection of attention, and the appearance of mind-control and nuanced persuasion. Most studies to date have focused on either the psychological principles involved in watching and performing magic or “neuromagic” - the neural correlates of such phenomena. Whereas performers sometimes question the contributions that modern science may offer to the advancement of the magical arts, the history of magic reveals that scientific discovery often charts new territories for magicians. In this research topic we sketch out the symbiotic relationship between psychological science and the art of magic. On the

one hand, magic can inform psychology, with particular benefits for the cognitive, social, developmental, and transcultural components of behavioural science. Magicians have a large and robust set of effects that most researchers rarely exploit. Incorporating these effects into existing experimental, even clinical, paradigms paves the road to innovative trajectories in the study of human behaviour. For example, magic provides an elegant way to study the behaviour of participants who may believe they had made choices that they actually did not make. Moreover, magic fosters a more ecological approach to experimentation whereby scientists can probe participants in more natural environments compared to the traditional lab-based settings. Examining how magicians consistently influence

spectators, for example, can elucidate important aspects in the study of persuasion, trust, decision-making, and even processes spanning authorship and agency. Magic thus offers a largely underused armamentarium for the behavioural scientist and clinician. On the other hand, psychological science can advance the art of magic. The psychology of deception, a relatively understudied field, explores the intentional creation of false beliefs and how people often go wrong. Understanding how to methodically exploit the tenuous twilight zone of human vulnerabilities – perceptual, logical, emotional, and temporal – becomes all the more revealing when top-down influences, including expectation, symbolic thinking, and framing, join the fray. Over the years, science has permitted magicians to concoct

increasingly effective routines and to elicit heightened feelings of wonder from audiences. Furthermore, on occasion science leads to the creation of novel effects, or the refinement of existing ones, based on systematic methods. For example, by simulating a specific card routine using a series of computer stimuli, researchers have decomposed the effect and reconstructed it into a more effective routine. Other magic effects depend on meaningful psychological knowledge, such as which type of information is difficult to retain or what changes capture attention. Behavioural scientists measure and study these factors. By combining analytical findings with performer intuitions, psychological science begets effective magic. Whereas science strives on parsimony and independent replication of

results, magic thrives on reproducing the same effect with multiple methods to obscure parsimony and minimise detection. This Research Topic explores the seemingly orthogonal approaches of scientists and magicians by highlighting the crosstalk as well as rapprochement between psychological science and the art of deception. Sponsored by Division 15 of APA, the second edition of this groundbreaking book has been expanded to 41 chapters that provide unparalleled coverage of this far-ranging field. Internationally recognized scholars contribute up-to-date reviews and critical syntheses of the following areas: foundations and the future of educational psychology, learners' development, individual differences, cognition, motivation, content area teaching, socio-cultural
