Dissection of the Dog During recent years the feeling that there was room for a book in English dealing with the anatomy of the dog has been steadily gaining ground. Doubtless, in the opinion of many, the gap can be adequately filled only by a systematic

treatise similar to the classic 'Anatomie des Hundes' of Ellenberger and Baum. Until some such work makes its appearance, perhaps the present publication may serve as a temporary means of supplying the deficiency. For

Online Library Guide To The Dissection Of Dog

several reasons it was decided to introduce the subject of canine anatomy to the English reader in the form of short notes planned to aid him in his desire to obtain first-hand knowledge by dissection. Herein are given directions which experience

be accomplished within a reasonable length of time. While primarily intended for the guidance of the student who proposes to join the ranks of a profession which already contains a fair number of specialists whose work necessitates a close knowledge of

the anatomy of the dog, it is hoped that these notes may be of some service to the student of comparative anatomy who wishes to gain an acquaintance with the structure of an easily obtained mammal. The nomenclature herein employed is that

This manual

The dog has been
chosen as subject of
dissection instead of

Online Library Guide To The Dissection Of Dog

a large herbivore for several reasons. The student-specimen ratio can be reduced with a resultant increase in time for dissection by the individual student. At the same time more material can be covered in a given period than by using

Online Library Guide To The Dissection Of Dog the horse or ox

owing to the smaller size of the specimen and the ease with which structures are cleaned and visualized. These and other advantages result not only in better preparation of a student to study the more economically

important animals, but also increases the time that can be devoted to the study of those regions most often involved surgically. The dog is cheaply purchased, preserved and prepared for dissection. After the arteries are filled

with red latex they stand out more vividly than in life. The large systemic veins can also be injected. A large part of a dissected dog can be seen in a single field of vision. Structures can be left in place, e.g., the heart is dissected

Terms used in
veterinary anatomy
are largely taken
from human
anatomy. Since in
the dog structures
closely resemble
those of man, an
advantage in making
homologies to the

mutual benefit of
teacher and student
results. In general all
terms have been
Anglicized except
most names of
muscles, and even
these Latin names
have been used as if
they were English in
some places. The
Latin terms were

Online Library
Guide To The

retained to

differentiate muscles from nerves and vessels; furthermore most veterinarians prefer to use them.

The improved BNA or INA terminology has been used almost entirely. Needless to say the excellent texts of Ellenberger

and Baum, and
Sisson and
Grossman have been
used frequently as
references. It is
probable that both
have influenced the
terminology more
than they should,
