In September 1983 the First International Headache Congress took place, the founding congress of the International Headache Society (IHS). This meeting was attended by around 200 headache specialists from some 20 countries. One of the principal goals of the IHS, which was formed in London in 1982, is to promote and stimulate interest and research in the headache field. In addition to the sponsorship of continued-education events, this also involves the coordination of scientific projects and the organization of future conferences. There is no doubt that headaches represent an everyday problem in medical practice. When the first headache clinics were established some years ago, they were regarded as very progressive. Today there are special outpatient centers and clinics for headache patients. However, this specialization has certainly not progressed very far. The fact is that differential diagnosis and treatment of recurrent and chronic headaches represents a broad field that cuts across many disciplines. Headaches are thus relevant not only to the neurologist, but also to the psychiatrist, the neuro surgeon, the internist, the endocrinologist, the psychologist, the pharmacologist, and the biochemist. Despite intensive research in numerous and very disparate medical disciplines there are still no generally accepted pathophysiologic concepts for many headache syndromes. Realizing the importance of a multidisciplinary forum, the IHS assumed the organization of this congress in collaboration with the German Migraine Society.

The Medical Brief

This is the first new book in many years to provide a comprehensive review of the latest theory, research, and treatment of chronic headaches from a biopsychological perspective. It is designed to make the tools of assessment and therapy widely accessible, while placing them in the context of how the disorders arise. The physiology and psychology of pain, and each disorder, are reviewed in an accessible manner. Clinical experience, laboratory data, and illustrative vignettes aid in treatment selection. Part I introduces the major types of headaches and provides a comprehensive review of pain. Part II details the major forms of headaches—migraine, tension-type, cluster, secondary, and headaches in children. A clinical presentation introduces each type of headache, followed by the physiological and psychological underpinnings and their implications for assessing and treating patients. Part III serves as a clinical guide for practitioners. The book closes with an analysis of how well the treatments work, the mechanisms behind the efficacy, and guidelines for treatment matching. A range of practical tools is incorporated. Clinical evaluation is reviewed in depth, including the interview, psychometrics, and psychophysiological assessment. Key sections of the 2004 International Headache Society diagnostic criteria serve as a “mini” diagnostic manual. Tables allow rapid look-up of the various disorders and their distinguishing characteristics; trigger point referral patterns; and the comparative merits of migraine medications. Blank headache diaries, appropriate for various stages of treatment, serve as models. A relaxation exercise is provided, as are muscle tension and hand temperature norms. Key terms are defined in the extensive glossary to help psychologists and medical professionals share vocabulary. Medical, herbal, and behavioral therapies are discussed in terms of the underlying science. Chronic Headaches is intended for healthcare providers, pain specialists, psychologists, researchers, and clinicians who study headaches in a variety of disciplines. This accessible, student-tested text is ideal for graduate courses on the psychology of pain and/or chronic headaches. Readers will gain expertise in headaches and a clear sense of how to translate this knowledge into clinical practice.
