hidden egg to munching caterpillar to cryptic chrysalis to nectar-sipping, winged adult. Written in an engaging, nontechnical style for anyone who wants to attract butterflies to the yard or garden, the book provides tips for making gardens caterpillar- and butterfly-friendly, in-depth profiles of more than fifty butterflies, descriptions of the food plants for a variety of both caterpillars and butterflies, and plant lists for easy selection and substitution, depending on where you live and what is available. For those who want specific advice on what to plant where, Ajilvsgi has

From the front lines of the fracking debate, a “field philosopher” explores one of our most divisive technologies. When philosophy professor Adam Briggle moved to Denton, Texas, he had never heard of fracking. Only five years later he would successfully lead a citizens' initiative to ban hydraulic fracturing in Denton—the first Texas town to challenge the oil and gas industry. On his journey to learn about fracking and its effects, he leaped from the ivory tower into the fray. In beautifully narrated chapters, Briggle brings us to town hall debates and

neighborhood meetings where citizens wrestle with issues few fully understand. Is fracking safe? How does it affect the local economy? Why are bakeries prohibited in neighborhoods while gas wells are permitted next to playgrounds? In his quest for answers Briggie meets people like Cathy McMullen. Her neighbors' cows asphyxiated after drinking fracking fluids, and her orchard was razed to make way for a pipeline. Cathy did not consent to drilling, but those who profited lived far out of harm's way. Briggie's first instinct was to think about fracking—deeply. Drawing on

philosophers from Socrates to Kant, but also on conversations with engineers, legislators, and industry representatives, he develops a simple theory to evaluate fracking: we should give those at risk to harm a stake in the decisions we make, and we should monitor for and correct any problems that arise. Finding this regulatory process short-circuited, with government and industry alike turning a blind eye to symptoms like earthquakes and nosebleeds, Briggle decides to take action. Though our field philosopher is initially out of his element—joining fierce activists like "Texas

Sharon," once called the "worst enemy" of the oil and gas industry—his story culminates in an underdog victory for Denton, now nationally recognized as a beacon for citizens' rights at the epicenter of the fracking revolution.

One woman . . . one year . . . 723 species of birds. . . In 2008, Lynn Barber's passion for birding led her to drive, fly, sail, walk, stalk, and sit in search of birds in twenty-five states and three provinces. Traveling more than 175,000 miles, she set a twenty-first century record at the time, second to only one other person in history. Over 272 days, Barber observed 723 species of birds in North America north of Mexico, recording a remarkable 333 new species in January but, with the dwindling returns typical to Big Year birding, only eight in December, a month that found her crisscrossing the continent from Texas to Newfoundland, from Washington to Ontario. In the months between, she felt every extreme of climate, well-being, and emotion. But, whether finally spotting an elusive Blue Bunting or seeing three species of eiders in a single

day, she was also challenged, inspired, and rewarded by nearly every experience. Barber's journal from her American Birding Association-sanctioned Big Year covers the highlights of her treks to forests, canyons, mountain ranges, deserts, oceans, lakes, and numerous spots in between. Written in the informal style of a diary, it captures the detail, humor, challenges, and fun of a good adventure travelogue and also conveys the remarkable diversity of North American birds and habitat. For actual or would-be "travel birders," Lynn Barber's Extreme Birder provides a fascinating, binoculars-eye view of one of the best-loved pastimes of nature lovers everywhere. "Lynn Barber challenges a traditionally male-dominated pursuit--the birding big year--and is successful beyond her wildest dreams. She is an inspiration for all who love adventure, nature, and birds."--Lynn

One Woman's Big Year

This book is an exploration of varying approaches to the study of the deposition, diagenesis and stratigraphy of evaporites. The volume includes papers from chemical modellers, who work on the basis of geochemical representations of the formative water bodies, and from basin-wide depositional-stratigraphical modellers, who propose depositional scenarios that are fitted to individual basinal pictures. Until now there have been only a few studies of evaporite formation that explain the characteristic features

we observe in the real rock record. This volume is a collection of relevant papers in which these features are integrated in a realistic manner, based on our new understanding of saline water bodies, to the diverse tectonic, chemical and depositional constraints of their individual basins. In addition there are several review articles that offer oversight and extensive referencing of basins worthy of further study. This book is a valuable resource for sedimentologists and stratigraphers looking for an up-to-date reference on evaporite deposits.

In-depth coverage of Texas politics coupled with timely readings, covering all aspects of Texas government, politics, and public policy.

Undertaking a Big Year requires a more extreme version of planning than what is needed to bird in a typical year. In a Big Year a birder is trying to see or hear new birds every day, day after day, throughout the whole year. The first woman to complete a North American Big Year (continental United States and Canada) and identify over 700 species, Lynn E. Barber clocked more than 175,000 miles and ticked off a then record setting 723 species over twelve months in 2008. Yet even as an anomaly—a female birder in the then male-dominated world of competitive birding—she took the initiative to reimagine the whole idea of a Big Year in the two biggest states in the country. At home in both Texas and Alaska, Barber

offers an inside look into how to plan, execute, and thoroughly enjoy a year of finding the birds that inhabit two of the nation's most diverse landscapes. The drastic differences between the climate, geography, plant life, and habitat at the far northern and southern edges of the US mainland mean seeing a distinct number of birds in each state that are not found in the other. Yet as states with both coastal and international boundaries, Texas and Alaska provide countless opportunities to see the most seasonally varied, far flying, and specifically adapted birds in the world. As Barber chronicles her travels throughout the Texan and Alaskan landscapes, serious and casual birders alike will appreciate her lively and informative prose and commitment to her distinct approach to the Big Year challenge.

Wildlife Responses to Climate Change is the

culmination of a three-year project to research and study the impacts of global climate change on ecosystems and individual wildlife species in North America. In 1997, the National Wildlife Federation provided fellowships to eight outstanding graduate students to conduct research on global climate change, and engaged leading climate change experts Stephen H. Schneider and Terry L. Root to advise and guide the project. This book

presents the results, with chapters describing groundbreaking original research by some of the brightest young scientists in America. The book presents case studies that examine: ways in which local and regional climate variables affect butterfly populations and habitat ranges how variations in ocean temperatures have affected intertidal marine species the potential effect of reduced snow cover on plants in the Rocky Mountains the potential effects of

climate change on the distribution of vegetation in the United States how climate change may increase the susceptibility of ecosystems to invasions of non-native species the potential for environmental change to alter interactions between a variety of organisms in whitebark pine communities of the Greater Yellowstone Ecosystem Also included are two introductory chapters by Schneider and Root that discuss the rationale behind the

project and offer an overview of climate change and its implications for wildlife. Each of the eight case studies provides important information about how biotic systems respond to climatic variables, and how a changing climate may affect biotic systems in the future. They also acknowledge the inherent complexities of problems likely to arise from changes in climate, and demonstrate the types of scientific questions that

need to be explored in order to improve our understanding of how climate change and other human disturbances affect wildlife and ecosystems. Wildlife Responses to Climate Change is an important addition to the body of knowledge critical to scientists, resource managers, and policymakers in understanding and shaping solutions to problems caused by climate change. It provides a useful
