Health and science journalist Chelsea Conaboy explodes the concept of “maternal instinct” and tells a new story about what it means to become a parent. Conaboy expected things to change with the birth of her child.

What she didn't expect was how different she would feel. But she would soon discover what was behind this: her changing brain. Though Conaboy was prepared for the endless dirty diapers, the sleepless nights, and the joy of holding her newborn, she did not

anticipate this shift in self, as deep as it was disorienting. *Mother Brain* is a groundbreaking exploration of the parental brain that untangles insidious myths from complicated realities. New parents undergo major structural and functional brain changes, driven by

hormones and the deluge of stimuli a baby provides. These neurobiological changes help all parents—birthing or otherwise—adapt in those intense first days and prepare for a long period of learning how to meet their child's needs. Pregnancy produces such

significant changes in brain anatomy that researchers can easily sort those who have had one from those who haven't. And all highly involved parents, no matter their path to parenthood, develop similar caregiving circuitry. Yet this emerging science,

which provides key insights into the wide-ranging experience of parenthood, from its larger role in shaping human nature to the intensity of our individual emotions, is mostly absent from the public conversation about parenthood. The story that exists in the science
