Mankind is constantly facing different challenges in our dynamically changing world. What we pretty much need is cooperation and alliance to overcome the problems we have to face. Our conflicts of interest and ideological opposition have to be put aside. Without a wide-scale social alliance we will not be able to find the answers to the questions that have properly arisen because of our irresponsible behavior. In the Middle Ages natural resources were so abundantly available that mankind’s needs were pretty easily met. We had to do nothing else than to cut out of nature everything we happened to need in a specific moment of time. Mankind snatched the opportunity but did not really chew the cud. They took away what they wanted. Nevertheless, with the onset of the industrial revolution, the rules of the game started to change. The energy output of the machines reached higher and higher levels, but at the same time, the rate of charge they exerted on the environment had also uninterruptedly increased. We opted for an "elegant" solution. We just simply hushed up the problem. For a long time, the protection of the environment had been a disregarded marginal field ignored completely by the political powers. Nevertheless, the environmental catastrophes warned us to take action in a very short while, but the fire extinguishing might have started too late; hence the operation of some of the energy-supplying systems produced an immense economic benefit for several lobby groups. Petrol, natural gas, and other common yet not really efficient sources of energy, which at the same time have had a deleterious influence on the environment, are constantly dwindling away. Fuel prices reach the stars. If we see a temporary price decrease, we take a deep breath. Nonetheless, this is nothing other than the end game.

Remarkable changes are to come. If this does not happen or is delayed, a global catastrophe is expected to come. When might this downturn happen? What other sources can replace the petrol? For the moment, no one can answer these questions. Could anyone? According to some thinking the progress of history is not linear but cyclic. Many of the ideas had been born many centuries or even many millenniums ago in the heads of certain persons. Some of them put their ideas even on paper, or others might have built them. Who were they? If someone comes up with an idea that differs pretty much from the ordinary ones of his era, he cannot really be optimistic about a warm welcome. He is looked at as a weirdo at most. In the worst case he is burnt at the stake because of not having accepted the traditions. It is actually not worth going too far. In the past, the ones who were asking too many questions had to face the ecclesiastical or secular powers, whereas today these are replaced by the petroleum lobby. However, the end result is the same, unfortunately: a rented parcel in a quiet graveyard. Documents and experimental utensils are disappearing or are destroyed practically as a routine. Certain academic circles are declaring that "the idea is pure fantasy; this cannot be true because it contradicts the laws of nature!" Of course, they forget to mention what they exactly mean about "laws of nature" since "nature" or "universe" are boundless notions the full comprehension and mapping of which is impossible. Making use of our rules and laws we manage to get access to those parts about which we confidently state that we have managed to understand. Can we, however, talk about real comprehension? All our rules are based on semblances and simplifications. We want to humanize something that is totally independent of us. We overestimate our role. We abuse nature instead of serving it. Some recognized this problem in Hungary and abroad as well.

Generations of readers have relished Polya’s deft—indeed, brilliant—instructions on stripping away irrelevancies and going straight to the heart of the problem.

Despite the publication of hundreds of textbooks in this field, each one intended to provide an improvement over previous textbooks, students of accounting continue to remain perplexed as a result of numerous subject areas that must be remembered and correlated when solving problems. Various interpretations of accounting terms also contribute to the difficulties of mastering the subject. In a study of accounting, REA found the following basic reasons underlying the inherent difficulties of accounting: No systematic rules of analysis were ever developed to follow in a step-by-step manner to solve typically encountered problems. This results from numerous different conditions and principles involved in a problem that leads to many possible different solution methods. To prescribe a set of rules for each of the possible variations would involve an enormous number of additional steps, making this task more burdensome than solving the problem directly due to the expectation of much trial and error. Current textbooks normally explain a given principle in a few pages written by an accounting professional who has insight into the subject matter not shared by others. These explanations are often written in an abstract manner that causes confusion as to the principle’s use and application. Explanations then are often not sufficiently detailed or extensive enough to make the reader aware of the wide range of applications and different aspects of the principle being studied. The numerous possible variations of principles and their applications are usually not discussed, and it is left to the reader to discover this while doing exercises. Accordingly, the average student is expected to rediscover that which has long been established and practiced, but not always published or adequately explained. The examples typically following the explanation of a topic are too few in number and too simple to enable the student to obtain a thorough grasp of the involved principles. The explanations do not provide sufficient basis to solve problems that may be assigned for homework or given on examinations. Poorly solved examples such as these can be presented in abbreviated form which leaves out much explanatory material between steps, and as a result requires the reader to figure out the missing information. This leaves the reader with an impression that the problems and even the subject are hard to learn - completely the opposite of what an example is supposed to do. Poor examples are often worded in a confusing or obscure way. They might not state the nature of the problem or they present a solution, which appears to have no direct relation to the problem. These problems usually offer an overly general discussion - never revealing how or what is to be solved. Many examples do not include accompanying diagrams or graphs denying the reader the exposure necessary for drawing good diagrams and graphs. Such practice only strengthens understanding by simplifying and organizing accounting processes. Students can learn the subject only by doing the exercises themselves and reviewing them in class, obtaining experience in applying the principles with their different ramifications. In doing the exercises by themselves, students find that they are required to devote considerable more time to accounting than to other subjects, because they are uncertain with regard to the selection and application of the theorems and principles involved. It is also often necessary for students to discover those “tricks” not revealed in their texts (or review books) that make it possible to solve problems easily. Students must usually resort to methods of trial and error to discover these “tricks,” therefore finding out that they may sometimes spend several hours to solve a single problem. When reviewing the exercises in classrooms, instructors usually request students to take turns in writing solutions on the boards and explaining them to the class. Students often find it difficult to explain in a manner that holds the interest of the class, and enables the remaining students to follow the material written on the boards. The remaining students in the class are thus too occupied with copying the material off the boards to follow the professor’s explanations. This book is intended to aid students in accounting overcome the difficulties described by supplying detailed illustrations of the solution methods that are usually not apparent to students. Solution methods are illustrated by problems that have been selected from those most often assigned for class work and given on examinations. The problems are arranged in order of complexity to enable students to learn and understand a particular topic by reviewing the problems in sequence. The problems are illustrated with detailed, step-by-step explanations, to save the students large amounts of time that is often needed to fill in the gaps that are usually found between steps of illustrations in textbooks or review/outline books. The staff of REA considers accounting a subject that is best learned by allowing students to view the methods of analysis and solution techniques. This learning approach is similar to that practiced in various scientific laboratories, particularly in the medical fields. In using this book, students may review and study the illustrated problems at their own pace; students are not limited to the time such problems receive in the classroom. When students want to look up a particular type of problem and solution, they can readily locate it in the book by referring to the index that has been extensively prepared. It is also possible to locate a particular type of problem by glancing at just the material within the boxed portions. Each problem is numbered and surrounded by a heavy black border for speedy identification.

"Love your neighbor like yourself" is a divine recommendation which too often takes just the opposite way in the midst of the human community. Unfortunately, this fact is observed across every race and religion in this earth. At different levels of course, we tend to behave like crabs toward our fellow men. It means that we are hypocrites, wicked, envious, insincere, jealous, hateful; all this, just for shellfish reasons. Let us love one another like he has loved us. This is the key to peaceful and loving cohabitation. This is the antidote against this social and spiritual cancer.

"It was the best of church, it was the worst of church..." [not Charles Dickens] In some ways, the church has a horrendous track record and is deserving of much of the hate, accusation and mistrust it has received. But, in many other ways, the church has also been monumental in affecting great systemic change, being first on the scene in crisis and on the forefront of reaching out to and loving well those considered the least of these. To those of you who believe church is the worst thing ever: You're right! To those of you who believe church is the best thing ever: You're right! The church was God's idea and it is the plan He has chosen to bring transformation to a world desperately in need of a deeper experienceof His love. He doesn't appear to have a plan B. We are it! i call this book, 'i, church' because more than a building or a meeting or a list of do's and don'ts, the church is about the people. It is about me. And it is about you. If you love Jesus and have chosen to follow Him, then you are the church. Let's figure out together how to be the best church we can be. "Brett Anderson weaves a picture of the church that is stark and real. He sees through church politics and denominational blinkers and defines the core of what the church is and isn't and what God desires it to be." Adam Kahane spent years working in the world's hotspots, and came away with a new understanding of how to resolve conflict in a way that seems reasonable - and doable - to all parties. The result is Solving Tough Problems. Written in a relaxed, persuasive style, this is not a "how-to" book with glib answers, but rather, a very personal story of the author's progress from a young "expert" convinced of the need to provide cold, "correct" answers to an effective facilitator of positive change - by learning how to create environments that enable new ideas and creative.

How to Solve It A New Aspect of Mathematical MethodPrinceton University Press

This concise, self-contained textbook gives an in-depth look at problem-solving from a mathematician's point-of-view. Each chapter builds off the previous one, while introducing a variety of methods that could be used when approaching any given problem. Creative thinking is the key to solving mathematical problems, and this book outlines the tools necessary to improve the reader's technique. The text is divided into twelve chapters, each providing corresponding hints, explanations, and finalization of solutions for the problems in the given chapter. For the reader's convenience, each exercise is marked with the required background level. This book implements a variety of strategies that can be used to solve mathematical problems in fields such as analysis, calculus, linear and multilinear algebra and combinatorics. It includes applications to mathematical physics, geometry, and other branches of mathematics. Also provided within the text are real-life problems in engineering and technology. Thinking in Problems is intended for advanced undergraduate and graduate students in the classroom or as a self-study guide. Prerequisites include linear algebra and analysis.

In my 31 years as a business coach and consultant to businesses, I've seen practically dozens of business owners fail and go under -- not because they weren't talented or smart enough -- but because they were trying to re-invent the wheel rather than rely on proven, tested methods that work. Organizations (and individuals) frequently struggle to make good decisions. They spend money, invest in new technology, and invest enormous amounts of time and effort reorganizing in fruitless efforts to solve thorny problems. Why?Years of training and reinforcement in school and at work, time pressures and deadlines, and inherent psychological biases cause us to jump to conclusions before we even understand the problem we're attempting to solve.This book will help you make better decisions by eliminating that tendency. You'll learn a powerful, four-step process that ensures you will deeply understand a problem before pursuing any given solution: (1) gathering both facts and data, so you can accurately grasp the situation; (2) properly framing the problem, so you can avoid cognitive biases; (3) isolating contributing factors, so you can manage complex situations; (4) finding the root cause, so you can avoid ineffective band-aids.Following this framework enables you to generate insight before you take action. Rather than needlessly hiring more people or spending money on new equipment and technology, you'll be able to identify the bottlenecks, root causes, and structural impediments that create the problems in the first place. It reduces the chronic fire-fighting your organization suffers from, while increasing the likelihood that your problem stays solved.

Many technical obstacles to effective innovation no longer exist: today, companies possess global networks that can connect with knowledge from virtually any source. Today's challenge is to collaboratively transform that knowledge into higher-value innovation. Their book introduces groundbreaking strategies and models for consistently achieving this goal. Authors Alpheus Bingham and Dwayne Spradlin draw on their own experience building InnoCentive, the pioneering global platform for open innovation (a.k.a. "crowdsourcing"). Writing for business executives, R&D leaders, and innovation strategists, Bingham and Spradlin demonstrate how to dramatically increase the flow of high-value ideas and innovative solutions both within enterprises and beyond their boundaries. They show: Why open innovation works so well. How to use open innovation to become more agile and entrepreneurial. How to access Idea Markets more quickly, and get more value from them. How to overcome new forms of "Not Invented Here" syndrome. How to implement cultural, organizational, and management changes that lead to greater innovation. New trends in open innovation--and the opportunities they present. The authors present many new open innovation case studies, from P&G and Eli Lilly to NASA and the City of Chicago.

Good Vibrations is my story of how I had my voice restored to functional use. It is a step by step account of the exercises I did, and the fears I encountered. It also contains email correspondence of two people who were diagnosed with SD and I instructed each of them in the exercises by email with their voices being improved.

"It's Not About the Shark opens the door to the groundbreaking science of solutions by turning problems--and how we solve them--upside down. When we have a problem, most of us zero in, take it apart, and focus until we have it solved. David Niven shows us that focusing on the problem is exactly the wrong way to find an answer. Putting problems at the center of our thoughts shuts down our creative abilities, depletes stamina, and feeds insecurities. It's Not About the Shark shows us how to transform our daily lives, our work lives, and our family lives with a simple, but rock-solid principle: If you start by thinking about your problems, you'll never make it to a solution. If you start by thinking about a solution, you'll never worry about your problems again. Through real-life examples and psychology research, David Niven shows us why: *Focusing on the problem first makes us 17 times less likely to find an answer *Being afraid of a problem is natural: we're biologically primed to be afraid *Finding a problem creates power - which keeps you from finding a solution *Working harder actually hides answers *Absolute confidence makes you less likely to find the answer *Looking away from a problem helps to see a solution *Listening only to yourself is one of the best ways to find an answer Combining hard facts, good sense, and a strong dose of encouragement, David Niven provides fresh and positive ways to think about problem solving.
