other modern appliance, vehicle, or other device has one or more computers embedded inside it. One cannot purchase a current-model automobile, for example, without several computers on board to do everything from monitoring exhaust emissions, to operating the anti-lock brakes, to telling the transmission when to shift, and so on. Appliances such as clothes washers and dryers, microwave ovens, refrigerators, etc. are almost all digitally controlled. Gaming consoles like Xbox, PlayStation, and Wii are powerful computer systems with enhanced capabilities for user interaction. Computers are everywhere, even when we don't see them as such, and it is more important than ever for students who will soon enter the workforce to understand how they work. This book is completely updated

and revised for a one-semester upper level undergraduate course in Computer Architecture, and suitable for use in an undergraduate CS, EE, or CE curriculum at the junior or senior level. Students should have had a course(s) covering introductory topics in digital logic and computer organization. While this is not a text for a programming course, the reader should be familiar with computer programming concepts in at least one language such as C, C++, or Java. Previous courses in operating systems, assembly language, and/or systems programming would be helpful, but are not essential.

Rapid Prototyping of Digital Systems, Second Edition provides an exciting and challenging laboratory component for an undergraduate digital logic design class. The more advanced topics and exercises are also appropriate for consideration at schools that have an upper level course in digital logic or programmable logic. Design engineers working in industry will also want to consider this book for a rapid introduction to FPLD technology and logic synthesis using commercial CAD tools, especially if

they have not had previous experience with the new and rapidly evolving technology. Two tutorials on the Altera CAD tool environment, an overview of programmable logic, and a design library with several easy-to-use input and output functions were developed for this book to help the reader get started quickly. Early design examples use schematic capture and library components. VHDL is used for more complex designs after a short introduction to VHDL-based synthesis. A coupon is included with the text for purchase of the new UP 1X board. The additional logic

and memory in the UP 1X's FLEX 10K70 is useful on larger design projects such as computers and video games. The second edition includes an update chapter on programmable logic, new robot sensors and projects, optional Verilog examples, and a meta assembler which can be used to develop assemble language programs for the computer designs in Chapters 8 and 13.

all settings, and optional modules. Now updated to reflect the latest features! Since 1958 the Maritime Administration has continuously conducted instructions in use of collision avoidance radar for qualified U.S. seafaring personnel and representatives of interested Federal and State Agencies. Beginning in 1963, to facilitate the expansion of training capabilities and at the same time to provide the most modern techniques in training methods, radar simulators were installed in Maritime Administration's three region schools. It soon became apparent that to

properly instruct the trainees, even with the advanced equipment, a standardize up-to-date instruction manual was needed. The first manual was later revised to serve both as a classroom textbook and as an onboard reference handbook. "The time for rehashing America's lost battles on the world market has passed." "Now it's time to address a critical component of the economic battle plan: the product development process that creates the products that satisfy customer needs. How quickly these weapons of economic war are developed, how competitive they are, how timely they are deployed, and how supportable they are will determine the failure or success of American business in the 1990s." "Here is the right book at the right time...a concise blueprint to transform product development

from a collection of ad hoc activities into an integrated, smoothly operating process. Written by the Director of Corporate Engineering for Hewlett-Packard, one of the most successfully innovative companies in America today, *Accelerating Innovation* shows how successful, well-tested concepts from the manufacturing domain can be readily transformed into the needy world of new product innovation." "Filled with clear-sighted analysis and practical explanations, this book will help management unleash innovation and creativity in development processes to meet the urgent need for bringing new technology to customers faster and more effectively than the competition." "Discover how to

cope with the limited life span of today's products...anticipate changing consumer needs and desires...close the gap between new technology and products that apply it...bring leading-edge products to market fast...eliminate profit-threatening gaps between the "death" of obsolete products and the introduction of new ones...and enjoy higher returns on investment." "Accelerating Innovation provides a results-oriented model for transferring to product development the strategies that are moving manufacturers from the old era to the new one. Numerous real-life examples give you powerful insights into the time-based factoring and total quality management principles used so

successfully in manufacturing and shows how to implement them in the product development cycle. Key chapters address how to shorten the innovation cycle time, applying the principle that success springs from focusing on the right issues; manage organization change so that change goes where you want it to go - and quickly, transfer quality principles used on the assembly line to the process of developing raw information and adding value to it, reduce innovation time by implementing the cost of quality principle (cost as a function of when an error is detected), manage information flow and bottlenecks, minimize changeover time; and much, much more." "Does your organization really have a handle on new

product development? Are goals, objectives, processes, metrics, and controls in place? Are you equipped to create new products rationally and systematically, while continuously reducing innovation cycle times?" "Accelerating Innovation presents new thinking that will help you answer these questions with a resounding "yes." In product development, doing business the same old way is a formula for disaster. The time to act is long before the livelihood of the product development function is ever threatened. And if a company is trying to catch up, then it has to improve faster than its toughest competition if it ever expects to win." product development - success that is no longer a luxury, but a necessity for survival."--BOOK JACKET. Title Summary field provided by Blackwell North America, Inc. All Rights Reserved This book insures the legacy of the original 1950 classic, Process Heat Transfer, by Donald Q. Kern. This second edition book is divided into three parts: Fundamental Principles; Heat Exchangers; and Other Heat Transfer Equipment/ Considerations. - Part I provides a series of chapters concerned with introductory topics that are required when solving heat transfer problems. This part of the book deals with topics such as steady-state heat conduction, unsteady-state conduction, forced convection, free convection, and

radiation. - Part II is considered by the authors to be the “ meat ” of the book – addressing heat transfer equipment design procedures and applications. In addition to providing a more meaningful treatment of the various types of heat exchangers, this part also examines the impact of entropy calculations on exchanger design. - Part III of the book examines other related topics of interest, including boiling and condensation, refrigeration and cryogenics, boilers, cooling towers and quenchers, batch and unsteady-state processes, health & safety and the accompanying topic of risk. An Appendix is also included.
