# Innovation In The Crisis And Beyond Oecd

The collapse of  
U.S. productivity  
growth since the  
late 1960s has

been the most  
severe and  
persistent of recent  
economic  
problems. This  
volume reviews the  
extent of the  
growth slowdown,  
evaluates several  
contributing  
factors, and  
suggests strategies

for improvement.  
The authors find  
that inflation,  
recessions, oil  
price fluctuations,  
and other  
economic  
disruptions in the  
1970s had an  
averse effect on  
economic  
performance, but,

they suggest, a slowing in the pace of innovation and a failure to exploit the benefits of innovation also contributed to the weakness in productivity. Baily and Chakrabarti provide a comprehensive

Parallel trends prior to the shock, evidence of a drop within every major technology class, and consistent results using distress driven by commodity shocks--all suggest a causal effect of distress. Despite this, we find that
