***Mathematical probability and statistics are an attractive, thriving, and respectable part of mathematics. Some mathematicians and philosophers of science say they are the gateway to mathematics' deepest mysteries.***

**Moreover, mathematical statistics denotes an accumulation of mathematical discussions connected with efforts to most efficiently collect and use numerical data subject to random or deterministic variations. Currently, the concept of probability and mathematical statistics has become one of the fundamental notions of modern science and the philosophy of nature. ***The compartmentation of genetic information is a fundamental feature of the eukaryotic cell. The metabolic capacity of a eukaryotic (plant) cell and the steps leading to it are overwhelmingly an endeavour of a joint genetic cooperation between nucleus/cytosol, plastids, and mitochondria. Alter ation of the genetic material***

*in anyone of these compartments or exchange of organelles between species can seriously affect harmoniously balanced growth of an organism. Although the biological significance of this genetic design has been vividly evident since the discovery of non-Mendelian inheritance by Baur and Correns at the beginning of this century, and became indisputable in principle after Renner's work on interspecific nuclear/plastid hybrids (summarized in his classical article in 1934), studies on the genetics of organelles have long suffered from the lack of respectability. Non-Mendelian inheritance was considered a research sideline~ifnot a freak~by most geneticists, which becomes evident when one consults common textbooks. For instance, these have usually impeccable accounts of photosynthetic and respiratory energy conversion in chloroplasts and mitochondria, of metabolism and global circulation of the biological key elements C, N, and S, as well as of the organization, maintenance, and function of nuclear genetic information. In contrast, the heredity and molecular biology of organelles are generally treated as an adjunct, and neither goes as far as to describe the impact of the integrated genetic system.*

In *Oncology Massage - an integrative approach to cancer care* the authors have created a textbook which will provide both experienced and inexperienced therapists with a resource to expand their knowledge and understanding of working with people with cancer. Cancer occurrence and survivorship are now so common that every massage therapist will at some time work with clients who have been through cancer treatment. The short and long-term effects of biomedical cancer treatment require massage therapy adaptations to pressure, site, position and duration to provide safe and effective treatments. Informed massage therapists can support the body to promote overall wellness as well as identify the underlying secondary effects of cancer treatment that contribute to physical dysfunction. *Oncology Massage: An Integrative Approach to Cancer Care* provides massage therapists with essential information for: Treatment planning based on the physiology of cancer and cancer treatments Critical, thoughtful treatment decision making Consideration of the psychosocial effects of cancer Enhancing therapist self-awareness and building a therapeutic relationship. The information is presented in a clear and simple format with plentiful use of illustrations and

information boxes which allows it to be used both as a learning tool for those new to the field of oncology massage and as a resource for quick referral when working with new patients. The techniques of massage therapy change very little; it is the knowledge and understanding of their use that distinguishes a massage therapist. Oncology Massage is unusual in that it includes contributions not only from a range of experienced practitioners but also from people with cancer who have received massage during and after cancer treatment. This feedback from clients provides an invaluable addition to the understanding of how massage can be used as a safe and effective part of cancer care.
