Research Genesis and Development

Value creation is at the heart of an economic enterprise, defining its capability to serve customers and generate profits and growth. This fact has led to an ever-increasing set of tools and techniques that start with customers, focusing on serving their preferences from the very inception of a product until its disposal. And this data is required to implement a value creation approach that has its roots in the Management Accounting System (MAS). The resulting model is called the Value-based Cost Management System (VCMS). If you or any manager want to take the lessons you learned in product development, process management, and marketing, this book will help you extend this knowledge to your MAS. This book makes this transformation both logical and easy to implement, with a focus on the new types of information that can be garnered when the MAS is modified to fit the value creation approach. The authors of the book will provide, upon request, a simplified automated data collection template that will ease the implementation process.

This book, probably the first written from the perspective of software professionals, attempts to introduce them to the mysteries of strategic managerial accounting (SMA). The common view in the industry is that "accounting is for the accountants", despite the fact that IT professionals are regularly confronted by financial situations such as project pricing, performance measurement, risk estimation, costs allocation etc. While it is desirable and even necessary that every proposal be vetted by respective specialists, the speed and reliability of the process could improve if the people who originate the proposal had knowledge of the fundamentals that go into the decision making. Unfortunately most books on management accounting, whether strategic or otherwise, are written from the perspective of the manufacturing industry. The IT and services industry on the other hand has a unique cost structure, quite distinct from manufacturing, which needs to be dealt with from a different perspective. This book focuses on SMA in context of the IT software industry, and seeks to equip the IT professional with some basics of SMA to assist them in making more informed decisions.

The metaphor of a compass creates a mental schema for its four points named (1) goals and principles, (2) boundaries and constraints, (3) methods and models, and, (4) collegial relationships. Dynamic Chinese and some other Central Asian cultures, view the center as a fifth principal direction, giving a total of five points. The center represents a high standard ethical conduct and self-care, or moral compass.
