This revision guide will be a valuable resource and reference for students, assisting them to understand and learn the theory of IB Mathematics: Analysis and Approaches Higher Level. The Guide aims to help the IB student by both revising the theory and going through some well-chosen examples of the new IB Mathematics: Analysis and Approaches HL curriculum. By presenting the theory that every IB

This 2006-13 Edition of Mathematics HL & SL has been written specifically for the International Baccalaureate Syllabuses for students taking exams until November 2013. Students taking exams in May 2014 or later should buy the 2012-19 Edition instead of this one. The HL Options of Statistics and Probability, Set, Relations and Groups, and Series and Differential Equations are included. In each chapter the information relative to the topic is discussed and

several examples providing various approaches to the solutions are given. The exercises provided with each section have been carefully graded from the relatively easy to the more difficult. Answers to all odd-numbered questions and some even-numbered ones are provided. The required outcomes are featured at the end of each chapter.

I was a student for more than 20 years, and I have taught hundreds of students since I became a tutor and then a lecturer. Throughout my study and

teaching, I have witnessed that many of my classmates or students failed their exams. Some of them may have used time-consuming methods and have not completed all the questions, some of them may have had no idea about using appropriate formulae, or some of them may have skipped essential steps and just given the final results. All these behaviours result in losing marks. With these points in mind, using proper and efficient methods and giving correct and complete responses to questions play a significant role in

sitting for the test. As a student, it is very important to analyse what the examiners are testing you in their places. For example, a question worth four marks may be broken down as one mark for showing appropriate method or formula, one mark for substituting the corresponding values into the formula, one mark for working and one mark for finding correct value at the end. In this case, to obtain full marks at least four steps are necessary, and one or two more steps are recommended to improve the chance of obtaining full marks. In

this book, I summarise all the knowledge required for standard level mathematics for IB diploma. Some words are written in colour or bold to draw your attention where I think it is important or confusing. Some pragmatic and efficient methods for tests are introduced by some examples where students often have trouble or make mistakes based on my teaching experience. The questions from the papers in the last two years are taken as examples to show a detailed breakdown of marking including the reasons or

explanations for each mark. These real test questions may also help you to realise the importance of a section if you find more questions there. In some examples, a solution is given step by step for a non-calculator question, and a shortcut by a graphing calculator is also demonstrated since a similar question may appear on Paper 2. A `\textit{Ti-84 Plus Silver}` graphing calculator is used for demonstration because I think it is a little more complicated compared with the Casio calculators. The relevant pre-

Mathematics Standard Level for the IB Diploma is a single volume that matches the Mathematics Standard Level course of the International Baccalaureate Diploma Programme, to be taught from September 2004 for first examination in 2006. The book has been adapted in consultation with senior examiners to ensure complete and authoritative coverage of the syllabus. An introduction to a broad range of topics in deep learning, covering mathematical and conceptual background, deep learning techniques used in industry, and research perspectives. “Written by three experts in the field, Deep Learning is the only comprehensive book on the subject.”

and SpaceX Deep learning is a form of machine learning that enables computers to learn from experience and understand the world in terms of a hierarchy of concepts. Because the computer gathers knowledge from experience, there is no need for a human computer operator to formally specify all the knowledge that the computer needs. The hierarchy of concepts allows the computer to learn complicated concepts by building them out of simpler ones; a graph of these hierarchies would be many layers deep. This book introduces a broad range of topics in deep learning. The text offers mathematical and conceptual background, covering relevant concepts in linear algebra, probability theory and information theory, numerical computation, and machine learning. It describes deep learning

techniques used by practitioners in industry, including deep feedforward networks, regularization, optimization algorithms, convolutional networks, sequence modeling, and practical methodology; and it surveys such applications as natural language processing, speech recognition, computer vision, online recommendation systems, bioinformatics, and videogames. Finally, the book offers research perspectives, covering such theoretical topics as linear factor models, autoencoders, representation learning, structured probabilistic models, Monte Carlo methods, the partition function, approximate inference, and deep generative models. Deep Learning can be used by undergraduate or graduate students planning careers in either industry or research, and by software
