

Mcgraw Hill Ryerson Advanced Functions 12

Take a crash course in boosting operational efficiency! Whether a business manufactures trucks, delivers packages, or sells coffee, it lives and breathes on its operations. Without exception. Ensuring smooth, efficient processes is a challenging task--but the rewards are immense. The McGraw-Hill 36-Hour Course: Operations Management puts you on the fast track to bolstering and managing the effectiveness of your organization ' s operations. Complete with exercises, self-tests, and an online final exam, this virtual immersion course in operations management teaches you how to: Evaluate and measure existing systems ' performance Use quality management tools like Six Sigma and Lean Production Design new, improved processes Define, plan, and control costs of projects Take this in-depth course on operations management and put your vision into action. This is the only book on the syllabus. Class begins now!

The Molecular Nature of Matter and Change

Advanced Functions and Introductory Calculus

This book describes different methods that are relevant to the development and testing of control algorithms for advanced driver assistance systems (ADAS) and automated driving functions (ADF). These control algorithms need to respond safely, reliably and optimally in varying operating conditions. Also, vehicles have to comply with safety and emission legislation. The text describes how such control algorithms can be developed, tested and verified for use in real-world driving situations. Owing to the complex interaction of vehicles with the environment and different traffic participants, an almost infinite number of possible scenarios and situations that need to be considered may exist. The book explains new methods to address this complexity, with reference to human interaction modelling, various theoretical approaches to the definition of real-

world scenarios, and with practically-oriented examples and contributions, to ensure efficient development and testing of ADAS and ADF. Control Strategies for Advanced Driver Assistance Systems and Autonomous Driving Functions is a collection of articles by international experts in the field representing theoretical and application-based points of view. As such, the methods and examples demonstrated in the book will be a valuable source of information for academic and industrial researchers, as well as for automotive companies and suppliers.

Chemistry: The Molecular Nature of Matter and Change by Martin Silberberg has become a favorite among faculty and students. Silberberg's 4th edition contains features that make it the most comprehensive and relevant text for any student enrolled in General Chemistry. The text contains unprecedented macroscopic to microscopic molecular illustrations, consistent step-by-step worked exercises in every chapter, an extensive range of end-of-chapter problems which provide engaging applications covering a wide variety of freshman interests, including engineering, medicine, materials, and environmental studies. All of these qualities make **Chemistry: The Molecular Nature of Matter and Change** the centerpiece for any General Chemistry course.

The fifth edition of Romer's Advanced Macroeconomics continues its tradition as the standard text and the starting point for graduate macroeconomics courses and helps lay the groundwork for students to begin doing research in macroeconomics and

monetary economics. Romer presents the major theories concerning the central questions of macroeconomics. The theoretical analysis is supplemented by examples of relevant empirical work, illustrating the ways that theories can be applied and tested. In areas ranging from economic growth and short-run fluctuations to the natural rate of unemployment and monetary policy, formal models are used to present and analyze key ideas and issues. The book has been extensively revised to incorporate important new topics and new research, eliminate inessential material, and further improve the presentation.
