It is not the presence of microorganisms, but their interaction with patients that determines their influence on wound healing. Documenting this critical but often ignored aspect of the treatment process, Microbiology of Wounds discusses the microbiology and biology of human wounds in relation to infection and non-healing. Gain the Necessary Scientific and Clinical Knowledge Pertaining to Chronic and Acute Wounds The practice of wound healing is dynamic, infinitely complex, nonlinear, and prodigiously individualized to the patient.

When one considers the myriad host variables that contribute to the disease state, understanding the intricacies of chronic wounds becomes even more difficult. This book presents the necessary scientific and clinical data pertaining to chronic and acute wounds, and discusses inflammation, epithelialization, granulation tissue, and tissue remodeling. It details techniques for treating chronic and acute wounds and covers the mode of action and efficacy of anti-infectives used in treating wounds. Microbiology of Wounds answers the call for a definitive reference on chronic and acute wounds.

This contributed volume provides insights into multiple applications using microbes to promote productivity in agriculture, to produce biochemicals or to respond to challenges in biomedicine. It highlights the microbial production of nanocompounds with medical functionality alongside new anti-mycobacterial strategies, and introduces plant-growth-promoting Rhizobacteria as well as the correlation between biofilm formation and crop productivity. Further, the authors illustrate the green synthesis of biochemical compounds, such as hydroxamid acid or biosurfactants, using microbial and fungal enzymes. It inspires young researchers and experienced scientists in the field of microbiology to explore the combined use of green, white and red biotechnology for industrial purposes, which will be one of the central topics for future generations.
