There is a paradigm shift in plastic and reconstructive surgery from the interest of developing new surgical techniques into the application of new technologies via research based studies on stem cells, tissue engineering and new field of reconstructive transplantation such as e.g. face, hand or larynx transplants. This approach is relatively novel and introduced to plastic surgery within past decade. Thus there is an urgent need to facilitate access to this new knowledge which was not traditionally a part of plastic surgery curriculum. The most efficient way of introducing these new approaches is via presentation of pertinent to different fields (stem cell, transplantation, nerve regeneration, tissue engineering) experimental models which can be used as a tool to develop technologies of interest by different groups of surgeons. These surgical specialities which will be interested and benefit from the book include: plastic and reconstructive surgeons, microsurgcons, hand surgeons, orthopaedic surgeons, neurosurgeons and transplant surgeons.

This book offers a comprehensive set of principles that lead to ideal outcomes following treatment for Head and Neck Cancers, especially in those patients who need major reconstructive procedures. It goes beyond the scope of basic Head and Neck Cancer textbooks, or of reconstructive surgery texts, in that the essential focus is on optimal outcomes beyond fundamental evaluation and management. The book addresses a range of essential aspects: the chapters on Functional and Aesthetic considerations underscore crucial basics that should be understood by all surgeons, while other chapters relevant to all members of the Head and Neck team address Imaging, Robotics, Radiation Morbidities, Prosthetics and Quality of Life. Throughout the book, particular attention is given to high-quality photographs, flow diagrams and tables wherever possible, combined with crisp writing to achieve effective communication. The book is unique in the completeness of its approach: from the time of initial presentation, to the time patients resume their normal lives. Although written primarily for surgeons, its value extends to all members of the multi-disciplinary team managing Head and Neck Cancer patients today.

The second edition of Operative Plastic Surgery is a fully-updated, comprehensive text that discusses the most common plastic surgery procedures in great detail. It covers the classic techniques in plastic surgery, as well as the most recent technical advances, while maintaining a systematic approach to patient care within each chapter. Traversing the entirety of the human body, each chapter addresses assessment of defects, preoperative factors, pathology, trauma, operative indications and procedure, and more. Also covered is the operative room setup, with special consideration given to the operative plan, patient positioning and markings, and technique for each type of surgery. Detailing over 90 specific surgical techniques, this book covers both reconstructive and aesthetic plastic surgery. A new section addresses non-invasive techniques such as Botox, injectables, lasers, and skincare. New chapters throughout the book also include ALT flaps, nasal cleft deformities, ZMC fractures, augmentation mastopexy, body contouring for the massive weight loss patient, and endoscopic carpal tunnel repair. Led by Gregory R.D. Evans, this volume assembles thought leaders in plastic surgery to present operative surgery in a clear, didactic, and comprehensive manner, and lays the groundwork for ideas that we have just scratched the surface of, such as translational research, fat grafting, stem cells, and tissue engineering.
