Wherever machinery operates there will be seals of some kind ensuring that the machine remains lubricated, the fluid being pumped does not leak, or the gas does not enter the atmosphere. Seals are ubiquitous, in industry, the home, transport and many other places. This 5th edition of a long-established title covers all types of seal by application: static, rotary, reciprocating etc. The book bears little resemblance to its predecessors, and Robert Flitney has re-planned and re-written every aspect of the subject. No engineer, designer or manufacturer of seals can afford to be without this

technologies, and automated driver-assistance systems. The thirteenth Leeds-Lyon Tribology Symposium was devoted to the topic of Fluid Film Lubrication in celebration of the centenary of the publication of the classical paper by Professor Osborne Reynolds in which he identified the mechanism of hydrodynamic lubrication. These proceedings contain more than seventy papers, written by authors from all over the world, covering the entire spectrum of fluid film lubrication. Of particular interest is the detailed consideration of a wide range of machine elements - bearings, seals, cams, rolling elements, as well as the in-depth,

surface ships, and other marine structures where seal reliability is critical. The principles and procedures recommended, however, can be applied to other static and some dynamic underwater seals. Although O-rings are the only type of gasket discussed, the principles and most of the procedures can be applied to quad-rings and other forms of seal gaskets. The Handbook also provides general information to engineers, machinists, supply personnel, and procurement personnel concerning selection, design, storage, and handling of seal parts to ensure high reliability
