The Rough Guide to the Netherlands

Hearing Before the Committee on Oversight and Government Reform, House of Representatives, One Hundred Twelfth Congress, First Session, September 14, 2011

First Published in 2009. Routledge is an imprint of Taylor & Francis, an informa company.

Building Physics: Lighting, Seeing in the Artificial Environment deals with basic principles of lighting as used in architecture, in building maintenance, and in an artificial environment. The book starts with the process of how humans see; the interaction of the eye and mind; and the effects of fatigue, visual disorders, and age. The phenomena of light are then discussed - how light behaves and how it is measured. Light and light waves beyond the visible spectrum are explained scientifically as being part of the electromagnetic spectrum within the 400 to 760 nm ranges. The different light sources are identified as daylight and artificial lights, with many types of lamps under the latter. As regards artificial lighting, a lighting fitting has two functions: redistributes luminescence properly and provides a suitable receptacle for the lamp. The requirements when using artificial or natural light in an exterior or interior setting are enumerated. The book also explains the specifications of the amount of light and how this amount is calculated. Interior lighting, both from artificial and natural sources, is comprehensively discussed, including issues such as discomfort glare, reflected glare, design and aesthetics, lighting requirements in different kinds of buildings, and flammability properties. The text also tackles exterior lighting including decorative floodlights, lighting for tunnels and underpasses, and special problem areas. Architects, engineers, electricians, interior designers, lighting technicians, environmentalists, and readers with interest in home decor will find this book useful.

The essential how-to guide to designing and building LED systems, revised and updated The second edition of Practical Lighting Design with LEDs has been revised and updated to provide the most current information for developing light-emitting diodes products. The authors, noted authorities in the field, offer a review of the most relevant topics including optical performance, materials, thermal design and modeling and measurement. Comprehensive in scope, the text covers all the information needed to design LEDs into end products. The user-friendly text also contains numerous drawings and schematics that show how things such as measurements are actually made, and show how circuits actually work. Designed to be practical, the text includes myriad notes and illustrative examples that give pointers and how-to guides on many of the book's topics. In addition, the book's equations are used only for practical calculations, and are kept at the level of high-school algebra. This thoroughly expanded second edition offers: New chapters on the design of an LED flashlight, USB light, automotive taillight, and LED light bulbs A practical and user-friendly guide with dozens of new illustrations The nitty-gritty, day-to-day engineering and systems used to design and build complete LED systems An essential resource on

the cutting-edge technology of Light-Emitting Diodes Practical Lighting Design with LEDs helps engineers and managers meet the demand for the surge in usage for products using light-emitting diodes with a practical guide that takes them through the relevant fields of light, electronic and thermal design.

This is an important book, written by one of the top lighting designers in the country. Written at the end of a career as an architect and lighting designer, the book draws on the experience gained while living through a period of intense lighting development, from 1956 up to the millennium. It bridges the gap between the present day architect and lighting engineer, from the viewpoint of the 'independent lighting designer'. 'Lighting Modern Buildings' documents the part played by the independent lighting designer, leading to a greater understanding by architects and lighting engineers of the importance of lighting in architectural design. The book starts with an exploration of the basic human needs of vision and the perception of our exterior world...the intellectual and the physical...since this is what lighting is all about. To do this, it is necessary to trace the development of daylight from earliest times up to the present day; the starting point for any lighting design is the 'natural' source. Whilst an essential understanding of the role of daylight is the beginning, a knowledge of the various forms and properties of artificial light is essential; not only at night but during the day. In early buildings, there was one form of light - daylight - during the day and another - artificial - at night. No attempt was made to integrate the two. The situation today is different; there are many reasons for this, not least in the possibilities of modern structure. The book therefore has extensive coverage of day and night lighting and how it is designed to provide optimum solutions in building design. A major portion of Derek Phillips' book is devoted to 'design'. Sufficient technical detail is provided in the book to permit an understanding of the design principles of each scheme. Schemes illustrated vary from small domestic buildings, churches and workplace, to those devoted to leisure and sport. At the end of each section a series of conclusions are drawn leading to a philosophy of lighting design.
