Young adulthood - ages approximately 18 to 26 - is a critical period of development with long-lasting implications for a person's economic security, health and well-being. Young adults are key contributors to the nation's workforce and military services and, since many are parents, to the healthy development of the next generation. Although 'millennials' have received attention in the popular media in recent

years, young adults are too rarely treated as a distinct population in policy, programs, and research. Instead, they are often grouped with adolescents or, more often, with all adults. Currently, the nation is experiencing economic restructuring, widening inequality, a rapidly rising ratio of older adults, and an increasingly diverse population. The possible transformative effects of these features make focus on young adults especially important. A systematic approach to understanding and responding to the unique circumstances and needs of today's young adults can help to pave the way to a more productive

and equitable tomorrow for young adults in particular and our society at large. Investing in The Health and Well-Being of Young Adults describes what is meant by the term young adulthood, who young adults are, what they are doing, and what they need. This study recommends actions that nonprofit programs and federal, state, and local agencies can take to help young adults make a successful transition from adolescence to adulthood. According to this report, young adults should be considered as a separate group from adolescents and older adults. Investing in The Health and Well-Being of Young Adults makes

Racial and ethnic disparities in health care are known to reflect access to care and other issues that arise from differing socioeconomic conditions. There is, however, increasing evidence that even after such differences are accounted for, race and ethnicity remain significant predictors of the quality of health care received. In *Unequal Treatment*, a panel of experts documents this evidence and explores how persons of color experience the health care environment. The book examines how disparities in treatment may arise in

### Health Promotion and Disease Prevention in Clinical Practice

From a nationally recognized expert, an exposé of the worst excesses of our zeal for medical testing Going against the conventional wisdom reinforced by the medical establishment and Big Pharma that more screening is the best preventative medicine, Dr. Gilbert Welch builds a compelling counterargument that what we need are fewer, not more, diagnoses. Documenting the excesses of American medical practice that labels far too many of us as sick, Welch examines the social, ethical, and economic ramifications of a health-care system that unnecessarily diagnoses and treats patients, most of whom will not benefit from treatment, might be harmed by it, and would arguably be better off without screening. Drawing on twenty-five years of medical practice and research on the effects of medical testing, Welch explains in a straightforward, jargon-free

## Read Book Preventive Care Guidelines For 2014

style how the cutoffs for treating a person with "abnormal" test results have been drastically lowered just when technological advances have allowed us to see more and more "abnormalities," many of which will pose fewer health complications than the procedures that ostensibly cure them. Citing studies that show that 10 percent of two thousand healthy people were found to have had silent strokes, and that well over half of men over age sixty have traces of prostate cancer but no impairment, Welch reveals overdiagnosis to be rampant for numerous conditions and diseases, including diabetes, high cholesterol, osteoporosis, gallstones, abdominal aortic aneurysms, blood clots, as well as skin, prostate, breast, and lung cancers. With genetic and prenatal screening now common, patients are being diagnosed not with disease but with "pre-disease" or for being at "high risk" of developing disease.

## Read Book Preventive Care Guidelines For 2014

Revealing the economic and medical forces that contribute to overdiagnosis, Welch makes a reasoned call for change that would save us from countless unneeded surgeries, excessive worry, and exorbitant costs, all while maintaining a balanced view of both the potential benefits and harms of diagnosis. Drawing on data, clinical studies, and anecdotes from his own practice, Welch builds a solid, accessible case against the belief that more screening always improves health care.

According to the Census Bureau, in 2003 more than 43 million Americans lacked health insurance. to the public. Insuring America's Health recommends principles related to universality, continuity of coverage, affordability to individuals and society, and quality of care to guide health insurance reform. These principles are based on the evidence reviewed in the committee's previous five reports and on new analyses of past and present federal, state, and local efforts to reduce uninsurance. The report also demonstrates how those principles can be used to assess policy options. The committee does not recommend a specific coverage strategy. Rather, it shows how various approaches could extend coverage and achieve certain of the committee's principles.

chlamydia in asymptomatic sexually active women, including pregnant women, who are younger than age 25 years or at increased risk, but not other patient populations. PURPOSE: To update the 2005 and 2007 systematic reviews for the U.S. Preventive Services Task Force on screening for gonorrhea and chlamydia in men and women, including pregnant women and adolescents. participants, study design, analysis, followup, and results and a second investigator confirmed key data.

Investigators independently dual-rated study quality and applicability using established criteria. DATA SYNTHESIS:

Screening a subset of asymptomatic young women for chlamydia in a good-quality trial did not statistically significantly reduce pelvic inflammatory disease over the following year (relative risk, 0.39 [95% CI, 0.14

to 1.08]), while one previous trial reported a reduction. An observational study evaluating a risk prediction tool to identify persons with chlamydia in high-risk populations had low predictive ability and applicability. In 10 new studies of asymptomatic participants, nucleic acid amplification tests demonstrated sensitivity of 86% or greater and specificity of 97% or greater for diagnosing gonorrhea and chlamydia,

regardless of specimen type or test. LIMITATIONS: Studies of screening benefits and harms were lacking for men, pregnant women, adolescents, and subgroups. Only screening tests and methods cleared by the U.S. Food and Drug Administration for current clinical practice were included to determine diagnostic accuracy, excluding rectal, pharyngeal, and self-administered specimens obtained outside a clinical setting. CONCLUSIONS:

Chlamydia screening in young women may reduce pelvic inflammatory disease. Nucleic acid amplification tests are accurate for diagnosing gonorrhea and chlamydia in asymptomatic persons using various types of specimens. Research is needed on the effectiveness of screening to reduce adverse health outcomes in specific population groups, effectiveness of different screening strategies, and adverse effects of screening to further inform practice
