

## Principles Of Barrier Nursing In The Veterinary Hospital

The Future of Nursing explores how nurses' roles, responsibilities, and education should change significantly to meet the increased demand for care that will be created by health care reform and to advance improvements in America's increasingly complex health system. At more than 3 million in number, nurses make up the single largest segment of the health care work force. They also spend the greatest amount of time in delivering patient care as a profession. Nurses therefore have valuable insights and unique abilities to contribute as partners with other health care professionals in improving the quality and safety of care as envisioned in the Affordable Care Act (ACA) enacted this year. Nurses should be fully engaged with other health professionals and assume leadership roles in redesigning care in the United States. To ensure its members are well-prepared, the profession should institute residency training for nurses, increase the percentage of nurses who attain a bachelor's degree to 80 percent by 2020, and double the number who pursue doctorates. Furthermore, regulatory and institutional obstacles -- including limits on nurses' scope of practice -- should be removed so that the health system can reap the full benefit of nurses' training, skills, and knowledge in patient care. In this book, the Institute of Medicine makes recommendations for an action-oriented blueprint for the future of nursing.

The two-volume "Manual of Nursing" is a comprehensive and up-to-date work on the nursing profession in South Africa. It covers the whole nursing curriculum and broadens the student's scope of knowledge by discussing subjects not included in midwifery, critical care nursing, community nursing and psychiatric nursing. Easy referencing ensures that the set (encapsulating the integrated nursing course) is of immediate and practical use. This work discusses medical and surgical conditions from a nursing perspective. Volume One introduces certain basics of nursing theory and practice and it includes a section dealing with nursing-related services.

Whilst this book is primarily compiled for nurses who care for patients with eye disease, it will be useful to other health professionals who are also interested in the holistic care of such patients, e.g. opticians, orthop tists, social workers and junior medical staff. The care is presented as a systematic approach to the more common actual and potential problems. Typically, a problem is identified with a desired outcome and the nursing interventions possible to achieve this. Evaluation has not been included as this is dependent on an identified time limit for outcomes to be achieved which is individual to each patient. Part One covers the general aspects of ophthalmie care in the various situations where patients are nursed, e.g. casualty, theatre, wards. Part Two is based on a medical model, where each section of the eye is studied separately; the applied physiology of that part of the eye; the more common conditions affecting it; the possible medical management of the condition and the nursing care of the patient taking into account the medical prescription. The list of medical conditions is not exhaus tive, and only a general guideline of medical management is given as far as it influences nursing care. A list of widely available books for further reference to ocular pathology and medical management is given in the Appendix.
